## **Chapter 1**

# **VXG Cloud Agent Library**

- 1. Build system
- 2. Library compilation
- 3. Application development
- 4. API reference

## **Chapter 2**

## **Build System**

### 2.0.1 Overview

VXG Cloud Agent library uses Meson build system as a modern, fast and flexible build system that supports easy to set up and maintain a cross-compilation process.

It's recommended to refer to the Meson guide.

## 2.0.2 C++ Toolchain Requirements

### IMPORTANT: This projects requires C++ toolchain with C++11 support

VXG Cloud Agent Library requires modern C++11 so in order to build and use this library the user needs a compiler with C++11 support.

GCC supports C++11 since version 4.8.1 released on May 31, 2013.

## C++11 Support in GCC

GCC 4.8.1 was the first feature-complete implementation of the 2011 C++ standard, previously known as C++0x.

This mode can be selected with the -std=c++11 command-line flag, or -std=gnu++11 to enable GNU extensions as well.

## 2.0.3 Build system installation

## IMPORTANT: This projects requires Meson version >= 0.56.0

It's recommended to use Ubuntu 20.04 LTS distribution in development process but other distributions or operation systems are also supported by Meson.

Please refer to Meson installation guide to get and install Meson, preferable way to install Meson is pip method.

Quick install guide for Ubuntu 20.04. If you have an old version of meson already installed please remove it first.

```
sudo apt-get update sudo apt-get install -y python3-pip git ninja-build curl tzdata python3-tz pip3 install git+https://github.com/mesonbuild/meson@0.56.0 # pip3 puts meson main script into the $HOME/.local/bin/ directory, you need to # add $HOME/.local/bin/ into your PATH environment variable, for bash shell you # can run the following command and restart the shell session. echo 'export PATH=$HOME/.local/bin:$PATH' >> $HOME/.bashrc # Check currently installed meson version
```

4 Build System

## **Chapter 3**

## **Application Development**

## 3.1 Overview

An application that uses VXG Cloud Agent Library should implement 3 classes derived from the base classes provided by the library:

- · agent::callback common callbacks class, only on\_bye callback is mandatory for implementation
- agent::media::stream class, abstract class for media streams, library provides basic media::rtsp\_stream implementation which retransmits RTSP source stream to the endpoint of the VXG Cloud, all callbacks are stubbed. Developer normally should implement own class derived from the media::stream with own vxg::media::Streamer::ISource implementation(vxg::media::ffmpeg::Source class implementation from the ffmpeg\_source.cc can be used as a reference), or if RTSP source is acceptable developer can implement own class derived from the media::rtsp\_stream but with callbacks implemented.
- agent::event\_stream class, abstract class for events generation.

Any callback implementation as well as ISource::init and ISource::finit implementations should be non-blocking, VXG Cloud messages processing is single-threaded which means any VXG Cloud messages are handled sequentially hence no new message will be processed until the callback triggered by the previous message is returned.

The library provides the stub implementation for most of the virtual methods of these classes, the stub implementation prints a log message about this method is not implemented and returns an error, the final application should implement all virtual methods on its own.

Most of the callbacks are just getter/setter for the library's objects.

## 3.2 Examples

## 3.2.1 Minimal application example

### Headers and namespaces:

```
#include <agent/manager.h>
#include <agent/rtsp-stream.h>
#include <utils/logging.h>
#include <utils/properties.h>
using namespace vxg::cloud;
using namespace vxg::cloud::agent;
```

Common callbacks class, minimal implementation derived from the agent::callback class:

```
using namespace vxg::cloud;
class agent_callback_minimal : public agent::callback {
public:
    virtual void on_bye(proto::bye_reason reason) override {
        vxg::logger::warn("Connection close {}", json(reason).dump());
    }
    virtual void on_registered(const std::string& sid) override {
        // Save Cloud registration session id in the local properties file.
        // This is required for the fast reconnection to the Cloud.
        props.set("prev_sid", sid);
    }
};
```

Create and start agent object agent::manager with one basic media stream agent::media::rtsp\_stream

```
using namespace vxg::cloud::agent;
// Agent
manager::ptr agent;
// VXG Cloud token
proto::access_token::ptr access_token =
   proto::access_token::parse(vxg_cloud_token);
// Agent callback
callback::ptr cb = std::make unique<agent callback minimal>();
// Media stream
std::vector<agent::media::stream::ptr> streams;
media::stream::ptr stream =
   std::make_shared<media::rtsp_stream>(rtsp_url, "DemoStream");
streams.push_back(stream);
// Create agent
if ((agent = agent::manager::create(std::move(cb), access_token,
                                    streams)) == nullptr) {
    vxg::logger::error("Failed to create agent");
    return EXIT_FAILURE;
if (!quit && !agent->start())
   quit = true;
```

### Complete minimal example:

```
#include <signal.h>
#include <args.hxx>
#include <agent/manager.h>
#include <agent/rtsp-stream.h>
#include <utils/logging.h>
#include <utils/properties.h>
using namespace vxg::cloud;
using namespace vxg::cloud::agent;
static bool quit = 0;
static vxg::properties props;
#if !defined(_WIN32)
static void signal_handler(int sig) {
   if (sig == SIGINT || sig == SIGTERM) {
      fprintf(stderr, "\nSIGTERM received\n\n");
        quit = true;
    }
#endif
using namespace vxg::cloud;
class agent_callback_minimal : public agent::callback {
public:
    virtual void on_bye(proto::bye_reason reason) override {
        vxg::logger::warn("Connection close {}", json(reason).dump());
    virtual void on_registered(const std::string& sid) override {
        \ensuremath{//} Save Cloud registration session id in the local properties file.
        // This is required for the fast reconnection to the Cloud.
        props.set("prev_sid", sid);
std::string vxg_cloud_token;
std::string rtsp_url;
bool parse_args(int argc, char** argv) {
    args::ArgumentParser parser("This is a test program.", "");
    args::HelpFlag help(parser, "help", "Display this help menu", {'h', "help"});
    args::CompletionFlag completion(parser, {"complete"});
    args::Options::Required);
    args::Positional<std::string> url(parser, "rtsp_url", "RTSP stream url", "",
                                       args::Options::Required);
    args::Flag secure_connection_arg(
        parser, "",
         "Use secure cloud connetion(enables encryption, cloud agent library "
        "must be compiled with openssl support enabled)",
        {"secure-channel", 's'});
```

3.2 Examples 7

```
parser.ParseCLI(argc, argv);
        vxg_cloud_token = args::get(token);
        rtsp_url = args::get(url);
        profile::global::instance().insecure_cloud_channel =
    !args::get(secure_connection_arg);
} catch (const args::RequiredError& e) {
        std::cout « e.what() « std::endl;
        return false;
    } catch (const args::Completion& e) {
        std::cout « e.what();
        return false:
    } catch (const args::Help&) {
        std::cout « parser;
        return false;
    } catch (const args::ParseError& e) {
        std::cerr « e.what() « std::endl;
        std::cerr « parser;
        return false;
    return true;
int main(int argc, char** argv) {
    vxg::properties::reset("agent-test.props");
    // Try to load and set previously saved session id.
// This is required for the fast reconnection to the Cloud.
    if (!props.get("prev_sid").empty())
        profile::global::instance().cm_registration_sid = props.get("prev_sid");
    // Parse args and retreive token and rtsp url
    if (!parse_args(argc, argv))
        return EXIT_FAILURE;
#if !defined(_WIN32)
    // Catch signal
    signal(SIGINT, signal_handler);
    signal(SIGTERM, signal_handler);
    signal(SIGPIPE, signal_handler);
#endif
    vxg::logger::info("VXG Cloud Agent Library Version: {}",
                       vxg::cloud::agent::version());
    using namespace vxg::cloud::agent;
    // Agent
    manager::ptr agent;
    // VXG Cloud token
    proto::access_token::ptr access_token =
       proto::access_token::parse(vxg_cloud_token);
    // Agent callback
    callback::ptr cb = std::make_unique<agent_callback_minimal>();
    // Media stream
    std::vector<agent::media::stream::ptr> streams;
    media::stream::ptr stream =
        std::make_shared<media::rtsp_stream>(rtsp_url, "DemoStream");
    streams.push_back(stream);
    // Create agent
    if ((agent = agent::manager::create(std::move(cb), access_token,
                                         streams)) == nullptr) {
        vxg::logger::error("Failed to create agent");
        return EXIT_FAILURE;
    if (!quit && !agent->start())
        quit = true;
    // Spin main thread until stopped
    while (!quit) {
       std::this_thread::sleep_for(std::chrono::seconds(1));
    agent->stop();
    agent = NULL;
    vxg::logger::info("Agent stopped");
    return EXIT_SUCCESS;
```

## 3.2.2 Complete application example

## Common callback class: derived from agent::callback

```
using namespace vxg::cloud;
class my_agent_callback : public agent::callback {
public:
    virtual void on_bye(proto::bye_reason reason) override {
        vxg::logger::error("Error {}", json(reason).dump());
    }
    virtual bool on_raw_msg(std::string client_id, std::string& data) override {
        vxg::logger::info("Raw message {} from client '{}'", data, client_id);
        // Reply json
```

```
data = "{\"reply\": \"OK\"}";
virtual bool on_get_log(std::string& log_data) override {
   log_data = "log messages...";
   vxg::logger::warn("{} not implemented", __func__);
    return true;
virtual bool on_start_backward_audio(std::string url) override {
    // Start backward audio playback from url
vxg::logger::warn("{} not implemented", __func__);
    return false:
virtual bool on_stop_backward_audio(std::string url) override {
    vxg::logger::warn("{} not implemented", __func__);
virtual bool on_get_cam_video_config(proto::video_config& config) override {
   vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_set_cam_video_config(
    const proto::video_config& config) override {
vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_get_cam_audio_config(proto::audio_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_set_cam_audio_config(
    const proto::audio_config& config) override {
vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_get_ptz_config(proto::ptz_config& config) override {
   vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_cam_ptz(proto::ptz_command& command) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_get_osd_config(proto::osd_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_set_osd_config(const proto::osd_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_get_wifi_config(proto::wifi_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on set wifi config(
    const proto::wifi_network& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_get_motion_detection_config(
    proto::motion_detection_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_set_motion_detection_config(
    const proto::motion_detection_config& config) override {
vxg::logger::warn("{} not implemented", __func__);
    return false:
virtual bool on_get_cam_events_config(
    proto::events_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false:
virtual bool on_set_cam_events_config(
    const proto::events_config& config) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
virtual bool on_get_timezone(std::string& timezone) override {
    vxg::logger::warn("{} not implemented", __func__);
virtual bool on_set_timezone(std::string timezone) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false:
```

3.2 Examples 9

```
}
virtual bool on_get_memorycard_info(
    proto::event_object::memorycard_info_object& info) override {
    vxg::logger::warn("{} not implemented", __func__);
    return false;
}
};
```

#### Media stream callback class: derived from agent::media::stream

```
class my_media_stream : public media::rtsp_stream {
public:
    my_media_stream(std::string url, std::string name)
         : media::rtsp_stream(url, name) {}
    bool get_supported_stream(proto::supported_stream_config& config) override {
        vxg::logger::warn("{} default implementation should be overriden",
                              func__);
        config.id = cloud_name();
        config.video = "Video" + std::to_string(0);
// config.audio = "Audio" + std::to_string(0);
         return true;
    virtual bool get_stream_caps(proto::stream_caps& caps) override {
        vxg::logger::warn("{} not implemented", __func__);
        return false;
    virtual bool get_stream_config(
        proto::stream_config& streamConfig) override {
vxg::logger::warn("{} not implemented", __func__);
        return false;
    virtual bool set_stream_config(
        const proto::stream_config& streamConfig) override {
        vxg::logger::warn("{} not implemented", __func__);
        return false;
    virtual bool get_snapshot(
        proto::event_object::snapshot_info_object& snapshot) override {
         vxg::logger::warn("{} not implemented", __func__);
        return false;
    virtual std::vector<proto::video_clip_info> record_get_list(
        vxg::cloud::time begin,
         vxg::cloud::time end,
        bool align) override
        std::vector<proto::video_clip_info> empty_vector(0);
vxg::logger::warn("{} not implemented", __func__);
        return empty_vector;
    virtual proto::video_clip_info record_export(
        vxg::cloud::time begin,
        vxg::cloud::time end) override {
        proto::video_clip_info clip;
vxg::logger::warn("{} not implemented", __func__);
         // empty clip
        return clip;
    virtual bool start_record() override {
        vxg::logger::warn("{} not implemented", __func__);
        return false:
    virtual bool stop_record() override {
        vxg::logger::warn("{} not implemented", __func__);
};
```

### Event stream callback class: derived from agent::media::event\_stream

```
class my_event_stream : public agent::event_stream {
public:
    my_event_stream(std::string name) : agent::event_stream(name) {}
    virtual bool start() {
        vxg::logger::warn("{} not implemented", __func__);
        return false;
    }
    virtual void stop() { vxg::logger::warn("{} not implemented", __func__); }
    virtual bool init() {
        vxg::logger::warn("{} not implemented", __func__);
        return false;
    }
    virtual void finit() { vxg::logger::warn("{} not implemented", __func__); }
    virtual bool set_trigger_recording(bool enabled, int pre, int post) {
        vxg::logger::warn("{} not implemented", __func__);
        return false;
    }
    virtual bool get_events(std::vectorproto::event_config>& configs) {
```

```
return false;
}
virtual bool set_events(const std::vector<proto::event_config>& config) {
    return false;
}
};
```

## Creating and start agent instance with all callbacks:

```
using namespace vxg::cloud::agent;
// Agent
manager::ptr agent;
// VXG Cloud token
proto::access_token::ptr access_token =
   proto::access_token::parse(vxg_cloud_token);
// Agent callback
callback::ptr cb = std::make_unique<my_agent_callback>();
// Media stream
std::vector<agent::media::stream::ptr> streams;
media::stream::ptr stream =
    std::make_shared<my_media_stream>(rtsp_url, "MyMediaStream");
streams.push_back(stream);
// Event stream
std::vector<agent::event_stream::ptr> event_streams;
event stream::ptr event stream =
   std::make_shared<my_event_stream>("MyEventStream");
event_streams.push_back(event_stream);
// Create agent
if ((agent = agent::manager::create(std::move(cb), access_token, streams,
                                    event_streams)) == nullptr) {
    vxg::logger::error("Failed to create agent");
   return EXIT_FAILURE;
if (!quit && !agent->start())
    quit = true;
```

## 3.2.3 Linking application against the VXG Agent Cloud Library

There are 3 possible ways of how to build and link your application

1. Building the application inside the VXG CLoud Agent library's Meson project, the app will be assembled during the library project compilation in this case.

You need to add a new executable target into the main meson.build file, please refer to the example app build target declaration:

```
cloud_agent_minimal = executable('cloud-agent-minimal', 'src/cloud-agent-minimal.cc',
   install : true, dependencies: dep)
```

User must declare own executable target with a list of sources and dependencies, user may need to declare own dependencies if application requires it.

## This method is not recommended as it makes updating of the VXG Cloud Agent library mostly not possible or very difficult for application developer

- 2. Building your app using your own build system and linking against the installed library.

  Running the install step from the compile section installs the binary libraries and headers into the directory you specified during the setup step, it also puts the pkg-config's .pc files into the prefix directory which could be used by your own build system.
- 3. Preferred and recommended way of application development is to hold the app as a separate Meson project and use the VXG Cloud Agent library as a Meson subproject of the application's Meson project.

Using this approach gives the most flexible and convenient workflow for updating the VXG Cloud Library, all library dependencies will be promoted to the main project and will be also accessible by the application.

### How does it work

- Assuming you have a Meson build system installed
- Start a new Meson project with a following command:
  meson init -l cpp -n your-project-name

3.2 Examples 11

· As a result of this command you should have the following files tree:

```
|-- meson.bulld
|-- your_project_name.cpp
```

• Add VXG Cloud Agent library as a Meson subproject

All subprojects should be located in the  ${\tt subprojects}$  directory so you have to create it first  ${\tt mkdir}$   ${\tt subprojects}$ 

Now you have 2 options depending on how you want to store the VXG Cloud Agent library sources:

- (a) If you want to store the VXG Cloud Agent library as a files tree locally.
  - Create a symlink to the library path inside the subprojects dir:

    ln -s path/to/vxgcloudagent subprojects/vxgcloudagent

Or you can just move vxgcloudagent directory inside the subprojects dir.

• Create a library's Meson wrap file inside the subprojects dir, the name of the file should be the same as symlink you created in 1.1 and the content of the file should be:

```
[wrap-file]
directory = vxgcloudagent
[provide]
vxgcloudagent = vxgcloudagent_dep
```

(b) If you want to store the library in a git repository you just need to create a wrap file with the content like below:

```
[wrap-git]
url=https://your-git-repo-url.com/path/vxgcloudagent.git
# You can specify tag, branch or commit hash as revision
revision=master
[provide]
vxgcloudagent = vxgcloudagent_dep
```

You can find the example app Meson project in the example/app directory of the VXG Cloud library sources package.

## **Library Compilation Guide**

#### 4.0.1 Library build process

Here is a compilation quickstart guide:

· First of all you need to have a build system and toolchain installed

#### · Setup the build directory

```
meson setup --prefix=path/to/install --strip -Dbuildtype=debug builddir/
# --prefix=path specifies the installation path
# --strip indicates that final binaries should be stripped
# -Dbuildtype= specifies the debug/release build type, please check the Meson docs about full list of the build types.
```

#### Build

```
meson compile -C builddir
# Or
ninja -C builddir
```

#### Install

```
meson install -C builddir
# Or
ninja -C builddir/ install
```

As a result of the install step you should have the library compiled and installed into the prefix directory you specified during the setup step.

#### Clean

```
ninja -C builddir clean
```

Or you can just delete the builddir, you will need to setup it again in this case.

rm -rf builddir

## 4.0.2 Cross-compilation

- By default Meson builds project for the host platform, but it's also possible to cross-compile the library and your application using Meson.
- Full Meson cross-compilation documentation can be found here.
- The difference between the host compilation described above and the cross-compilation is the additional --cross-file=path/to/cross-file.txt flag for the Meson Setup step, the Setup command should look like below:

```
meson setup --prefix=path/to/install --strip -Dbuildtype=debug --cross-file=path/to/cross-file.txt builddir/
```

cross-file.txt is the target platform description which in terms of Meson called a cross-file.

• cross-file example below is for the Debian provided arm-linux-gnueabihf toolchain installable using the Ubuntu's package manager command

sudo apt install g++-arm-linux-gnueabihf

• Example of the ARMv7 cross-file:

```
[host_machine]
system = 'linux'
cpu_family = 'arm'
cpu = 'armv7-a'
endian = 'little'
[built-in options]
# Example of platform specific CFLAGS and CXXFLAGS c_args = ['-mfloat-abi=hard', '-march=armv7-a+vfpv3']
cpp_args = c_args
default_library = 'static'
[properties]
# If your toolchain requires specifying the sysroot dir you can setup it like below, sysroot_dir is a constant declared in [constants] section of the cross-file
#sys_root = sysroot_dir
# Meson uses pkg-config and cmake to detect external dependencies
# Set the correct path to your cross-compilation pkgconfig directory if your app depends on some external dependencies like platform specific libs.

#pkg_config_libdir = sysroot_dir / 'usr/lib/pkgconfig/'
[constants]
cross_prefix = 'arm-linux-gnueabihf-'
#sysroot_dir = '/opt/arm-linux-gnueabihf/sysroot/'
[binaries]
c = cross_prefix + 'gcc'
cpp = cross_prefix + 'g++'
ar = cross_prefix + 'ar'
strip = cross_prefix + 'strip'
# You should specify your platform toolchain pkg-config binary here #pkgconfig = '/opt/arm-linux-gnueabihf/bin/pkg-config'
```

# **Deprecated List**

Global vxg::logger::reset (int argc, char \*\*argv, loglevel I, std::string syslog\_ident="VXGCloudAgent → Default", std::string crash\_logfile\_path="", std::string logfile\_path="", size\_t logfile\_max\_size=(1024 \*1024), size\_t logfile\_max\_files=3)

Use reset(const options& opts)

16 Deprecated List

# **Hierarchical Index**

## 6.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

vxg::cloud::agent::proto::access_token
alter_bool
vxg::cloud::agent::proto::audio_caps
vxg::cloud::agent::proto::audio_config
vxg::cloud::agent::proto::audio_stream_config
vxg::media::Streamer::StreamInfo::AudioInfo

# **Data Structure Index**

## 7.1 Data Structures

Here are the data structures with brief descriptions:

vxg::cloud::agent::proto::access_token	
VXG Cloud access token	65
alter_bool	
Alternative bool class Standard bool type has two states, this class adds 3rd state - undefined .	66
vxg::cloud::agent::proto::audio_caps	
Audio capabilities	69
vxg::cloud::agent::proto::audio_config	
Audio config	72
vxg::cloud::agent::proto::audio_stream_config	
Audio media stream config	74
vxg::media::Streamer::StreamInfo::AudioInfo	
Audio stream info	76
vxg::cloud::agent::callback	
VXG Cloud manager common callbacks class	78
vxg::cloud::agent::proto::stream_caps::caps_audio_object	
Audio streams capabilities	91
vxg::cloud::agent::proto::stream_caps::caps_video_object	
Video streams capabilities	93
vxg::cloud::agent::proto::event_caps	
Events capabilies	96
vxg::cloud::agent::proto::event_config	
Event config	98
vxg::cloud::agent::proto::event_object	
Event object	102
vxg::cloud::agent::manager::event_state::event_state_caps	107
vxg::cloud::agent::event_stream	
Event stream, abstract class for event generation	108
vxg::cloud::agent::proto::events_config	
	113
vxg::cloud::agent::proto::event_object::file_meta_info_object	
Meta file info struct	116
vxg::media::Streamer::ISink	117
vxg::media::Streamer::ISource	
ISource interface class	122
vxg::logger	
Logger class, current implementation based on spdlog	127

20 Data Structure Index

vxg::cloud::agent::manager	
VXG Cloud agent manager class	133
vxg::cloud::utils::motion::map	148
vxg::media::Streamer::MediaFrame	
Media frame container	150
vxg::cloud::agent::proto::event_object::memorycard_info_object  Memorycard info	154
vxg::cloud::agent::proto::motion_detection_caps	
Motion detection capabilities camera capabilities that limit possible motion detection configura-	
tion	155
vxg::cloud::agent::proto::motion_detection_config	
Motion detection config	156
vxg::cloud::agent::proto::event_object::motion_info_object	
Motion info	158
vxg::cloud::agent::proto::motion_region	
Motion detection related structs	159
vxg::logger::options	161
vxg::cloud::agent::proto::osd_caps	
OSD capabilities	164
vxg::cloud::agent::proto::osd_config	
OSD config	168
vxg::cloud::agent::proto::access_token::proxy_config	
Socks proxy settings	171
vxg::cloud::agent::proto::ptz_command	
PTZ command	172
vxg::cloud::agent::proto::ptz_config	172
PTZ config	174
vxg::cloud::agent::proto::ptz_preset	174
PTZ preset	175
vxg::cloud::agent::proto::event_object::record_info_object	175
Record_info	177
vxg::media::rtmp_sink	177
RTMP sink class	178
vxg::media::rtmp_source	170
RTMP source class	182
vxg::media::rtsp_source	102
RTSP source class	19/
	104
vxg::cloud::agent::media::rtsp_stream Implementation of the media::stream with RTSP source and NIY stubs	107
·	107
vxg::media::ffmpeg::Sink  Base ffmpeg sink class	104
vxg::cloud::agent::proto::event_object::snapshot_info_object	194
Snapshot info	199
•	199
vxg::media::ffmpeg::Source  Base ffmpeg source class	201
• •	201
vxg::cloud::agent::media::stream  Cloud agent media stream abstract class	206
	206
vxg::media::stream	010
Base media stream abstract class	213
vxg::cloud::agent::proto::stream_caps	047
Media stream capabilites	217
vxg::cloud::agent::proto::stream_config	010
Media stream config	219
vxg::media::Streamer::StreamInfo Stream info description	000
	220
vxg::cloud::agent::proto::supported_stream_config	200
Supported stream config	223

7.1 Data Structures 21

vxg::cloud::agent::proto::supported_streams_config
Supported streams config, list of supported_stream_config
vxg::cloud::utils::uri
vxg::cloud::agent::proto::video_caps
Video image capabilities
vxg::cloud::agent::proto::video_clip_info
Video recoding(mp4 file) clip description,
vxg::cloud::agent::proto::video_config
Video image config
vxg::cloud::agent::proto::video_stream_config
Video stream config
vxg::media::Streamer::StreamInfo::VideoInfo
Video stream info
vxg::cloud::agent::proto::wifi_config
WiFi config
vxg::cloud::agent::proto::wifi_network
WiFi network object

## **Namespaces**

- cloud
- media

## **Data Structures**

· class logger

Logger class, current implementation based on spdlog.

## 9.4 vxg::cloud Namespace Reference

## **Namespaces**

agent

VXG Cloud Agent namespace.

time\_spec

time point

• utils

## **Typedefs**

- using time = std::chrono::time\_point< std::chrono::system\_clock, time\_spec::precision >
- using duration = time\_spec::duration < time\_spec::precision >

## 9.4.1 Typedef Documentation

#### 9.4.1.1 duration

 ${\tt typedef\ time\_spec::precision\ >\ vxg::cloud::duration}$ 

Definition at line 43 of file config.h.

#### 9.4.1.2 time

typedef std::chrono::time\_point< std::chrono::system\_clock, time\_spec::precision > vxg::cloud::time

Definition at line 42 of file config.h.

## 9.5 vxg::cloud::agent Namespace Reference

VXG Cloud Agent namespace.

## **Namespaces**

- media
- proto

#### **Data Structures**

· class callback

VXG Cloud manager common callbacks class.

class event\_stream

Event stream, abstract class for event generation.

· class manager

VXG Cloud agent manager class.

## **Functions**

• std::string version ()

VXG Cloud Agent library version.

## 9.5.1 Detailed Description

VXG Cloud Agent namespace.

## 9.5.2 Function Documentation

## 9.5.2.1 version()

```
std::string vxg::cloud::agent::version ( )
```

VXG Cloud Agent library version.

Returns

std::string version string

## 9.6 vxg::cloud::agent::media Namespace Reference

## **Data Structures**

class rtsp\_stream

Implementation of the media::stream with RTSP source and NIY stubs.

• class stream

Cloud agent media stream abstract class.

## 9.7 vxg::cloud::agent::proto Namespace Reference

#### **Data Structures**

· struct access\_token

VXG Cloud access token.

· struct audio\_caps

Audio capabilities.

· struct audio\_config

Audio config.

• struct audio\_stream\_config

Audio media stream config.

struct event\_caps

Events capabilies.

· struct event\_config

Event config.

· struct event\_object

Event object.

· struct events\_config

Events config, list of event\_config objects.

· struct motion\_detection\_caps

Motion detection capabilities camera capabilities that limit possible motion detection configuration.

· struct motion detection config

Motion detection config.

struct motion\_region

Motion detection related structs.

struct osd\_caps

OSD capabilities.

struct osd\_config

OSD config.

struct ptz\_command

PTZ command.

struct ptz\_config

PTZ config.

struct ptz\_preset

PTZ preset.

struct stream\_caps

Media stream capabilites.

· struct stream\_config

Media stream config.

• struct supported\_stream\_config

Supported stream config.

• struct supported\_streams\_config

Supported streams config, list of supported\_stream\_config.

struct video\_caps

Video image capabilities.

· struct video\_clip\_info

Video recoding(mp4 file) clip description,.

· struct video\_config

Video image config.

```
    struct video_stream_config

           Video stream config.
    · struct wifi config
          WiFi config.
    · struct wifi network
          WiFi network object.
Typedefs
    · typedef wifi config wifi list
           wifi_config
```

#### **Enumerations**

```
enum mode { M_OFF, M_ON, M_AUTO, M_INVALID }
    Mode on/off.
enum video format { VF H264, VF H265, VF MJPEG, VF INVALID }
     Video codec format.
enum audio format {
 AF_G711A, AF_G711U, AF_RAW, AF_ADPCM,
 AF MP3, AF NELLY8, AF NELLY16, AF NELLY,
 AF_OPUS, AF_AAC, AF_SPEEX, AF_INVALID }
    Audio codec format.
enum audio_file_format { AFF_AU_G711U, AFF_MP3, AFF_WAV_PCM, AFF_INVALID }
    Audio file format.

    enum motion_sensitivity { MS_REGION, MS_FRAME, MS_INVALID }

    Motion sensitivity.

    enum motion region shape { MR RECTANGLE, MR ANY, MR INVALID }

    Motion region shape.
enum ptz_action {
 A_LEFT, A_RIGHT, A_TOP, A_BOTTOM,
 A ZOOM IN, A ZOOM OUT, A STOP, A INVALID }
    PTZ actions.
enum ptz_preset_action {
 PA CREATE, PA DELETE, PA GOTO, PA UPDATE,
 PA INVALID }
    PTZ preset action.
enum time_format_n { TF_12H, TF_24H, TF_INVALID }
    3.34 get_osd_conf (SRV) 3.35 osd_conf (CM) 3.36 set_osd_conf (SRV)
enum event_status { ES_OK, ES_ERROR, ES_INVALID }
    Event status.
enum event_type {
 ET_MOTION, ET_SOUND, ET_NET, ET_RECORD,
 ET_MEMORYCARD, ET_WIFI, ET_CUSTOM, ET_INVALID }
     Types of events.
enum memorycard status {
 MCS NONE, MCS NORMAL, MCS NEED FORMAT, MCS FORMATTING,
 MCS_INITIALIZATION, MCS_INVALID }
    Memory card status.
enum wifi encryption {
 WFE OPEN, WFE_WEP, WFE_WPA, WFE_WPA2,
 WFE_WPA_ENTERPRISE, WFE_WPA2_ENTERPRISE, WFE_INVALID }
     WiFi encryption type.
```

## 9.7.1 Typedef Documentation

## 9.7.1.1 wifi\_list

typedef wifi\_config vxg::cloud::agent::proto::wifi\_list

## wifi\_config

Definition at line 1155 of file config.h.

## 9.7.2 Enumeration Type Documentation

## 9.7.2.1 audio\_file\_format

enum vxg::cloud::agent::proto::audio\_file\_format

Audio file format.

## Enumerator

AFF_AU_G711U	AU file format, encoded in mu-law and sampled with 8 or 16 kHz;.
AFF_MP3	MP3 file format, in mono or stereo with bitrate of 64 kbps to 320 kbps and sample rate of 8
	to 48 kHz.
AFF_WAV_PCM	WAV file format, encoded in PCM audio that depends on what the product supports. It
	may support encoded as 8 or 16-bit mono or stereo and sample rate of 8 to 48 kHz;
AFF_INVALID	Invalid value.

Definition at line 147 of file caps.h.

## 9.7.2.2 audio\_format

enum vxg::cloud::agent::proto::audio\_format

Audio codec format.

## Enumerator

AF_G711A	G711A - PCMA, A-Law.
AF_G711U	G711U - PCMU, U-Law.
AF_RAW	PCM.
AF_ADPCM	G726LE.
AF_MP3	

### Enumerator

AF_NELLY8	
AF_NELLY16	
AF_NELLY	
AF_OPUS	
AF_AAC	AAC.
AF_SPEEX	
AF_INVALID	Invalid value.

Definition at line 106 of file caps.h.

#### 9.7.2.3 event\_status

enum vxg::cloud::agent::proto::event\_status

Event status.

### Enumerator

ES_OK	Ok.
ES_ERROR	Error.
ES_INVALID	Default status, invalid.

Definition at line 381 of file config.h.

# 9.7.2.4 event\_type

enum vxg::cloud::agent::proto::event\_type

Types of events.

# Enumerator

ET_MOTION	"motion" for motion detection events
ET_SOUND	"sound" for audio detection
ET_NET	"net" for the camera network status change
ET_RECORD	"record" CM informs server about necessity of changing of recording state
ET_MEMORYCARD	"memorycard" camera's memory-card status change
ET_WIFI	"wifi" status of camera's currently used Wi-Fi
ET_CUSTOM	Custom event.
ET_INVALID	Invalid event type.

Definition at line 404 of file config.h.

### 9.7.2.5 memorycard\_status

enum vxg::cloud::agent::proto::memorycard\_status

Memory card status.

#### Enumerator

MCS_NONE	No memorycard.	
MCS_NORMAL	Memorycard is OK.	
MCS_NEED_FORMAT	Need formatting.	
MCS_FORMATTING	Formatting ongoing.	
MCS_INITIALIZATION	Initialization, not mounted yet for example.	
MCS_INVALID	Invalid value.	

Definition at line 484 of file config.h.

### 9.7.2.6 mode

enum vxg::cloud::agent::proto::mode

Mode on/off.

#### Enumerator

M_OFF	
M_ON	
M_AUTO	
M_INVALID	

Definition at line 30 of file caps.h.

# 9.7.2.7 motion\_region\_shape

enum vxg::cloud::agent::proto::motion\_region\_shape

Motion region shape.

#### Enumerator

MR_RECTANGLE	Rectangle.
MR_ANY	Any shape.
MR INVALID	Invalid.

Definition at line 313 of file caps.h.

#### 9.7.2.8 motion\_sensitivity

enum vxg::cloud::agent::proto::motion\_sensitivity

Motion sensitivity.

#### Enumerator

MS_REGION	Indicates if sensitivity can be set for region.
MS_FRAME	Indicates if sensitivity can be only for the full frame.
MS_INVALID	Invalid value.

Definition at line 291 of file caps.h.

#### 9.7.2.9 ptz\_action

enum vxg::cloud::agent::proto::ptz\_action

PTZ actions.

# Enumerator

A_LEFT	Go left.
A_RIGHT	Go right.
A_TOP	Go tip.
A_BOTTOM	Go bottom.
A_ZOOM_IN	Zoom in.
A_ZOOM_OUT	Zoom out.
A_STOP	Stop current action.
A_INVALID	Invalid value.

Definition at line 527 of file caps.h.

# 9.7.2.10 ptz\_preset\_action

enum vxg::cloud::agent::proto::ptz\_preset\_action

PTZ preset action.

#### Enumerator

PA_CREATE	
PA_DELETE	
PA_GOTO	
PA_UPDATE	
PA_INVALID	

Definition at line 563 of file caps.h.

# 9.7.2.11 time\_format\_n

enum vxg::cloud::agent::proto::time\_format\_n

3.34 get\_osd\_conf (SRV) 3.35 osd\_conf (CM) 3.36 set\_osd\_conf (SRV)

Time format

#### Enumerator

TF_12H	12 hours
TF_24H	24 hours
TF_INVALID	Invalid value.

Definition at line 592 of file caps.h.

### 9.7.2.12 video\_format

enum vxg::cloud::agent::proto::video\_format

Video codec format.

#### Enumerator

VF_H264	H264 (AVC)
VF_H265	H265 (HEVC)
VF_MJPEG	Motion JPEG.
VF_INVALID	Invalid value.

Definition at line 81 of file caps.h.

### 9.7.2.13 wifi\_encryption

 $\verb"enum vxg::cloud::agent::proto::wifi_encryption"$ 

WiFi encryption type.

#### Enumerator

WFE_OPEN	No encryption.
WFE_WEP	WEP.
WFE_WPA	WPA-PSK.
WFE_WPA2	WPA2-PSK.
WFE_WPA_ENTERPRISE	WPA-Enterprise.
WFE_WPA2_ENTERPRISE	WPA2-Enterprise.
WFE_INVALID	Default, invalid value.

Definition at line 1078 of file config.h.

- alter\_bool (const bool &v)
- alter\_bool operator= (const bool &b)
- operator bool () const

#### **Data Fields**

• n\_alter\_bool val

#### **Friends**

- void from\_json (const nlohmann::json &j, alter\_bool &c)
- void to\_json (nlohmann::json &j, const alter\_bool &c)

# 10.2.1 Detailed Description

alternative bool class Standard bool type has two states, this class adds 3rd state - undefined.

This class used for json boolean => C++ bool type reflection. The B\_INVALID value of the C++ data indicates that source json has no such field.

Definition at line 168 of file unset-helper.h.

#### 10.2.2 Member Enumeration Documentation

#### 10.2.2.1 n alter bool

enum alter\_bool::n\_alter\_bool

Internal boolean values.

#### Enumerator

B_FALSE	false
B_TRUE	true
B_INVALID	Undefined, i.e. if the object was constructed from the json object this value means that original json had no such field.

Definition at line 170 of file unset-helper.h.

#### 10.2.3 Constructor & Destructor Documentation

### 10.2.3.1 alter\_bool() [1/2]

Definition at line 180 of file unset-helper.h.

# 10.3 vxg::cloud::agent::proto::audio\_caps Struct Reference

Audio capabilities.

```
#include <agent-proto/objects/caps.h>
```

Collaboration diagram for vxg::cloud::agent::proto::audio\_caps:

#### **Data Fields**

· alter\_bool mic

mic: bool, microphone is supported

· alter\_bool spkr

spkr: bool, speaker is supported

std::vector< mode > echo cancel

echo\_cancel: list of string, echo cancellation modes, empty or absent means not supported

· alter\_bool backward

backward: bool, backward audio supported.

• std::vector< audio format > backward formats

backward\_formats: list of audio\_format, list of supported backward formats.

std::vector< audio\_file\_format > audio\_file\_formats

audio file formats: list of string, list of supported formats of audio files.

# 10.3.1 Detailed Description

Audio capabilities.

Definition at line 484 of file caps.h.

#### 10.3.2 Field Documentation

#### 10.3.2.1 audio\_file\_formats

```
std::vector<audio_file_format> vxg::cloud::agent::proto::audio_caps::audio_file_formats
```

audio\_file\_formats: list of string, list of supported formats of audio files.

Definition at line 507 of file caps.h.

### 10.3.2.2 backward

```
alter_bool vxg::cloud::agent::proto::audio_caps::backward
```

backward: bool, backward audio supported.

Obsolete. Server will ignore it when backward\_formats exists. If true and backward\_formats is missed, server will interpret supported formats list as ["UNKNOWN"]

Definition at line 497 of file caps.h.

#### 10.3.2.3 backward\_formats

```
std::vector<audio_format> vxg::cloud::agent::proto::audio_caps::backward_formats
```

backward\_formats: list of audio\_format, list of supported backward formats.

Supported values: ["RAW", "ADPCM", "MP3", "NELLY8", "NELLY16", "NELLY16", "G711A", "G711U", "AAC", "SPE ← EX", "UNKNOWN"]. Empty list or missing parameter – camera doesn't support back audio channel.

Definition at line 503 of file caps.h.

#### 10.3.2.4 echo\_cancel

```
std::vector<mode> vxg::cloud::agent::proto::audio_caps::echo_cancel
```

echo\_cancel: list of string, echo cancellation modes, empty or absent means not supported

Definition at line 492 of file caps.h.

#### 10.3.2.5 mic

```
alter_bool vxg::cloud::agent::proto::audio_caps::mic
```

mic: bool, microphone is supported

Definition at line 486 of file caps.h.

#### 10.3.2.6 spkr

```
alter_bool vxg::cloud::agent::proto::audio_caps::spkr
```

spkr: bool, speaker is supported

Definition at line 489 of file caps.h.

# 10.7 vxg::cloud::agent::callback Class Reference

VXG Cloud manager common callbacks class.

```
#include <agent/callback.h>
```

# **Public Types**

typedef std::unique\_ptr < callback > ptr
 std::unique\_ptr to callback

#### **Public Member Functions**

virtual void on\_bye (proto::command::bye\_reason reason)=0

VXG Cloud Bye command callback.

virtual void on\_registered (const std::string &sid)

Registration on the Cloud has passed callback.

virtual bool on\_raw\_msg ( std::string client\_id, std::string &data)

raw message callback

virtual bool on\_get\_log ( std::string &log\_data)

Get logging data callback.

virtual bool on\_start\_backward\_audio ( std::string url)

Start backward audio stream.

virtual bool on\_stop\_backward\_audio ( std::string url)

Stop backward audio.

virtual bool on\_get\_cam\_video\_config (proto::video\_config &config)

Get video image config.

virtual bool on\_set\_cam\_video\_config (const proto::video\_config &config)

Set video input config.

virtual bool on get cam audio config (proto::audio config &config)

Get audio input configuration.

virtual bool on\_set\_cam\_audio\_config (const proto::audio\_config &config)

Set audio input/output config.

virtual bool on get ptz config (proto::ptz config &config)

Get PTZ config.

virtual bool on\_cam\_ptz (proto::ptz\_command &command)

PTZ command.

virtual bool on\_cam\_ptz\_preset (proto::ptz\_preset &preset\_op)

PTZ preset command.

virtual bool on\_get\_osd\_config (proto::osd\_config &config)

Get OSD config.

virtual bool on\_set\_osd\_config (const proto::osd\_config &config)

Set OSD config.

virtual bool on\_get\_wifi\_config (proto::wifi\_config &config)

Get WiFi config.

virtual bool on\_set\_wifi\_config (const proto::wifi\_network &config)

Set WiFi config.

• virtual bool on\_get\_motion\_detection\_config (proto::motion\_detection\_config &config)

Get motion detection configuration.

virtual bool on\_set\_motion\_detection\_config (const proto::motion\_detection\_config &config)

Set motion detection config.

virtual bool on\_get\_cam\_events\_config (proto::events\_config &config)

Get events configuration.

virtual bool on\_set\_cam\_events\_config (const proto::events\_config &config)

Set motion detection config.

virtual bool on\_get\_timezone ( std::string &timezone)

Get device timezone in IANA format.

virtual bool on\_set\_timezone ( std::string timezone)

Set device timezone in IANA format.

virtual bool on\_get\_memorycard\_info (proto::event\_object::memorycard\_info\_object &info)

Get memory card information, If this callback returned false or if info status not equal to proto::MCS\_NORMAL, the recording will not be started, i.e.

• virtual bool on\_cam\_upgrade\_firmware (const std::string &firmware)

Firmware upgrade.

virtual bool on\_audio\_file\_play (const std::string audio\_file\_data, const std::string filename)

Audio file play.

virtual bool on\_trigger\_event (proto::event\_object &event)

#### 10.7.1 Detailed Description

VXG Cloud manager common callbacks class.

Definition at line 17 of file callback.h.

#### 10.7.2 Member Typedef Documentation

#### 10.7.2.1 ptr

typedef std::unique\_ptr<callback> vxg::cloud::agent::callback::ptr

std::unique\_ptr to callback

Definition at line 20 of file callback.h.

### 10.7.3 Member Function Documentation

### 10.7.3.1 on\_audio\_file\_play()

Audio file play.

#### **Parameters**

in audio_file		Audio file binary data.
in	audio_file_format	Audio file data format.

#### Returns

true if firware upgrade was successfull. false if firware upgrade failed.

Definition at line 332 of file callback.h.

# 10.7.3.2 on\_bye()

VXG Cloud Bye command callback.

#### **Parameters**

reason	bye reason

### 10.7.3.3 on\_cam\_ptz()

PTZ command.

#### **Parameters**

in	command	ptz command
----	---------	-------------

#### Returns

true success

false PTZ command failure

Definition at line 162 of file callback.h.

### 10.7.3.4 on\_cam\_ptz\_preset()

#### PTZ preset command.

#### **Parameters**

in,out	preset_op	ptz preset operation, if operation is proto::PA_CREATE the callee should fill the token.	]
--------	-----------	--	---

#### Returns

true PTZ preset operation success false PTZ preset operation failure

Definition at line 174 of file callback.h.

#### 10.7.3.5 on\_cam\_upgrade\_firmware()

# Firmware upgrade.

#### **Parameters**

in	firmware	Firmware binary data.

#### Returns

true if firware upgrade was successfull. false if firware upgrade failed.

Definition at line 322 of file callback.h.

#### 10.7.3.6 on\_get\_cam\_audio\_config()

Get audio input configuration.

#### **Parameters**

out	config	audio input config
-----	--------	--------------------

#### Returns

true get audio input configuration success false get audio input configuration failed

Definition at line 126 of file callback.h.

# 10.7.3.7 on\_get\_cam\_events\_config()

Get events configuration.

#### **Parameters**

out	config	events config
-----	--------	---------------

#### Returns

true if config is valid false if config is invalid

Definition at line 261 of file callback.h.

#### 10.7.3.8 on\_get\_cam\_video\_config()

Get video image config.

#### **Parameters**

out	config	video image config
-----	--------	--------------------

#### Returns

true if get image config success false get image config failed

Definition at line 102 of file callback.h.

#### 10.7.3.9 on\_get\_log()

Get logging data callback.

Cloud API provides the way to request log data using Cloud API

#### **Parameters**

log_data log d
----------------

#### Returns

true on success false on failure

Definition at line 64 of file callback.h.

# 10.7.3.10 on\_get\_memorycard\_info()

Get memory card information, If this callback returned false or if info status not equal to proto::MCS\_NORMAL, the recording will not be started, i.e.

no agent::media::stream::record\_start() will be called.

# **Parameters**

out	info	memorycard info

#### Returns

true if info is valid false if info is not valid

Definition at line 312 of file callback.h.

#### 10.7.3.11 on\_get\_motion\_detection\_config()

Get motion detection configuration.

#### **Parameters**

	out	config	Motion detection config if return value is true	
--	-----	--------	---	--

#### Returns

true if config is valid false if failed to get motion detection config

Definition at line 235 of file callback.h.

#### 10.7.3.12 on\_get\_osd\_config()

#### Get OSD config.

### **Parameters**

```
out config OSD config
```

#### Returns

true OSD config get success, config is valid false OSD config get failure, config should not be used

Definition at line 186 of file callback.h.

# 10.7.3.13 on\_get\_ptz\_config()

Get PTZ config.

#### **Parameters**

#### Returns

true success

false Get PTZ config failed

Definition at line 150 of file callback.h.

# 10.7.3.14 on\_get\_timezone()

Get device timezone in IANA format.

## **Parameters**

out	timezone	name in IANA format

### Returns

true if timezone is valid
false if timezone is not valid

Definition at line 285 of file callback.h.

# 10.7.3.15 on\_get\_wifi\_config()

Get WiFi config.

#### **Parameters**

out	config	WiFi config
-----	--------	-------------

# Returns

true success false failed

Definition at line 210 of file callback.h.

# 10.7.3.16 on\_raw\_msg()

# raw message callback

#### **Parameters**

in	client⊷	unique id of the client, every raw messages session uses the same unique client_id
	_id	
in,out	data	raw message payload from client, output value will be sent to the client if return value
		is true

# Returns

true raw message handled and reply in the output data argument should be sent to the client as reply false raw message handling failure, data output argument should not be sent to client

Definition at line 52 of file callback.h.

# 10.7.3.17 on\_registered()

Registration on the Cloud has passed callback.

#### **Parameters**

```
sid Cloud connection session id. Must be saved and provided via the profile::global::instance().cm_register_sid before the next vxg::cloud::agent::manager::start()
```

Definition at line 36 of file callback.h.

# 10.7.3.18 on\_set\_cam\_audio\_config()

Set audio input/output config.

#### **Parameters**

config	audio input/output config
--------	---------------------------

#### Returns

true applied

false failed to set config

Definition at line 138 of file callback.h.

## 10.7.3.19 on\_set\_cam\_events\_config()

Set motion detection config.

#### **Parameters**

in	config	Motion detection config
----	--------	-------------------------

#### Returns

true if config was successfully set false if failed to set config

Definition at line 273 of file callback.h.

#### 10.7.3.20 on\_set\_cam\_video\_config()

Set video input config.

#### **Parameters**

config	video input config
009	

# Returns

true Video image input config was successfully set false Failed to set video input image config

Definition at line 114 of file callback.h.

# 10.7.3.21 on\_set\_motion\_detection\_config()

Set motion detection config.

#### **Parameters**

in c	onfig	motion detection	config	
------	-------	------------------	--------	--

# Returns

true if config was successfully set false if failed to set config

Definition at line 248 of file callback.h.

# 10.7.3.22 on\_set\_osd\_config()

# Set OSD config.

#### **Parameters**

in	config	OSD config

#### Returns

true OSD config was successfully set false failed to set OSD config

Definition at line 198 of file callback.h.

### 10.7.3.23 on\_set\_timezone()

Set device timezone in IANA format.

# **Parameters**

in timezone timezone in IANA form
-----------------------------------

#### Returns

true if timezone was successfully set false if timezone was not set

Definition at line 297 of file callback.h.

# 10.7.3.24 on\_set\_wifi\_config()

Set WiFi config.

#### **Parameters**

in (	config	WiFi configuration
------	--------	--------------------

# Returns

```
true if config is valid false if config is invalid
```

Definition at line 222 of file callback.h.

#### 10.7.3.25 on\_start\_backward\_audio()

Start backward audio stream.

#### **Parameters**

url

rtmp url for backward channel, device supports backward audio if on\_get\_cam\_audio\_config() set proto::audio\_config.caps spkr to true

Implementation should start rtmp client by its own, final implementation is also responsible for the demuxing, decoding and rendering of the audio stream.

#### Returns

true on success false on failure

Definition at line 80 of file callback.h.

# 10.7.3.26 on\_stop\_backward\_audio()

Stop backward audio.

#### **Parameters**

url backward audio url which was used to start the backward channel

Definition at line 91 of file callback.h.

# 10.7.3.27 on\_trigger\_event()

Definition at line 338 of file callback.h.

The documentation for this class was generated from the following file:

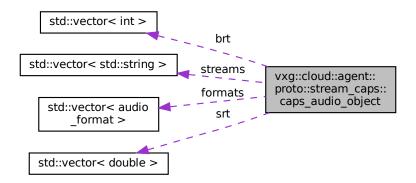

· callback.h

# 10.8 vxg::cloud::agent::proto::stream\_caps::caps\_audio\_object Struct Reference

Audio streams capabilities.

#include <agent-proto/objects/caps.h>

Collaboration diagram for vxg::cloud::agent::proto::stream\_caps::caps\_audio\_object:

## **Data Fields**

std::vector< std::string > streams

Mandatory: list of strings, audio ES that are covered by this capability config.

std::vector< audio\_format > formats

Mandatory: list of string, supported audio formats; currently only "AAC" and "G711U" is supported.

std::vector< int > brt

Mandatory: [min:int, max:int, step:int], range of bitrates, kbps.

• std::vector < double > srt

Mandatory: list of float, supported samplerates.

# 10.8.1 Detailed Description

Audio streams capabilities.

Definition at line 247 of file caps.h.

# 10.8.2 Field Documentation

# 10.8.2.1 brt

```
std::vector<int> vxg::cloud::agent::proto::stream_caps::caps_audio_object::brt
```

Mandatory: [min:int, max:int, step:int], range of bitrates, kbps.

Definition at line 259 of file caps.h.

#### 10.8.2.2 formats

```
std::vector<audio_format> vxg::cloud::agent::proto::stream_caps::caps_audio_object::formats
```

Mandatory: list of string, supported audio formats; currently only "AAC" and "G711U" is supported.

Definition at line 255 of file caps.h.

# 10.8.2.3 srt

```
std::vector<double> vxg::cloud::agent::proto::stream_caps::caps_audio_object::srt
```

Mandatory: list of float, supported samplerates.

Definition at line 263 of file caps.h.

## 10.8.2.4 streams

```
std::vector< std::string> vxg::cloud::agent::proto::stream_caps::caps_audio_object::streams
```

Mandatory: list of strings, audio ES that are covered by this capability config.

Definition at line 250 of file caps.h.

The documentation for this struct was generated from the following file:

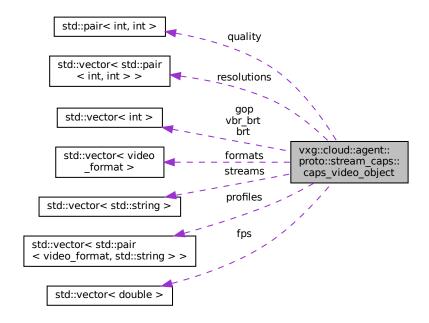

caps.h

# 10.9 vxg::cloud::agent::proto::stream\_caps::caps\_video\_object Struct Reference

Video streams capabilities.

#include <agent-proto/objects/caps.h>

Collaboration diagram for vxg::cloud::agent::proto::stream\_caps::caps\_video\_object:

#### **Data Fields**

std::vector< std::string > streams

Mandatory: list of strings, video ES that are covered by this capability config.

• std::vector< video\_format > formats

Mandatory: list of string, supported video formats; currently only "H.264" is supported.

std::vector< std::pair< video\_format, std::string > > profiles

Optional: list of pairs [string (format), string (profile)], list of profiles for formats (when they have).

• std::vector< std::pair< int, int > > resolutions

Mandatory: list of pairs [int (horz), int (vert)], - supported video resolutions.

std::vector< double > fps

Mandatory: list of float, supported framerates.

bool vbr

Mandatory: VBR is supported.

std::pair< int, int > quality

Optional: [min:int, max:int], range of quality for VBR.

std::vector< int > gop

Mandatory: gop: [min:int, max:int, step:int], range of gop sizes.

std::vector< int > brt

Mandatory: [min:int, max:int, step:int], range of bitrates, kbps.

std::vector< int > vbr\_brt

Optional: [min:int, max:int, step:int], range of bitrates, kbps.

· bool smoothing

Optional: True when stream smoothing can be controlled.

# 10.9.1 Detailed Description

Video streams capabilities.

Definition at line 177 of file caps.h.

# 10.9.2 Field Documentation

#### 10.9.2.1 brt

```
std::vector<int> vxg::cloud::agent::proto::stream_caps::caps_video_object::brt
```

Mandatory: [min:int, max:int, step:int], range of bitrates, kbps.

Definition at line 219 of file caps.h.

# 10.9.2.2 formats

```
std::vector<video_format> vxg::cloud::agent::proto::stream_caps::caps_video_object::formats
```

Mandatory: list of string, supported video formats; currently only "H.264" is supported.

Definition at line 185 of file caps.h.

### 10.9.2.3 fps

```
std::vector<double> vxg::cloud::agent::proto::stream_caps::caps_video_object::fps
```

Mandatory: list of float, supported framerates.

Definition at line 203 of file caps.h.

#### 10.9.2.4 gop

```
std::vector<int> vxg::cloud::agent::proto::stream_caps::caps_video_object::gop
```

Mandatory: gop: [min:int, max:int, step:int], range of gop sizes.

Definition at line 215 of file caps.h.

# 10.9.2.5 profiles

```
\label{lem:std::equation} \textbf{std::vector} < \textbf{std::pair} < \texttt{video\_format}, \quad \textbf{std::string} > \texttt{vxg::cloud::agent::proto::stream\_caps} \leftrightarrow \texttt{::caps\_video\_object::profiles}
```

Optional: list of pairs [string (format), string (profile)], list of profiles for formats (when they have).

Empty list means - color selection is not supported. "format" - one of listed in "formats" names. "profile"

• name of profile. Example: [["H.264", "Baseline"], ["H.264", "Main"], ["H.264", "High"]]

Definition at line 194 of file caps.h.

# 10.9.2.6 quality

```
std::pair<int, int> vxg::cloud::agent::proto::stream_caps::caps_video_object::quality
```

Optional: [min:int, max:int], range of quality for VBR.

Definition at line 211 of file caps.h.

# 10.9.2.7 resolutions

```
std::vector< std::pair<int, int> > vxg::cloud::agent::proto::stream_caps::caps_video_←
object::resolutions
```

Mandatory: list of pairs [int (horz), int (vert)], - supported video resolutions.

Definition at line 199 of file caps.h.

#### 10.9.2.8 smoothing

bool vxg::cloud::agent::proto::stream\_caps::caps\_video\_object::smoothing

Optional: True when stream smoothing can be controlled.

Definition at line 227 of file caps.h.

#### 10.9.2.9 streams

```
std::vector< std::string> vxg::cloud::agent::proto::stream_caps::caps_video_object::streams
```

Mandatory: list of strings, video ES that are covered by this capability config.

Definition at line 180 of file caps.h.

#### 10.9.2.10 vbr

bool vxg::cloud::agent::proto::stream\_caps::caps\_video\_object::vbr

Mandatory: VBR is supported.

Definition at line 207 of file caps.h.

# 10.9.2.11 vbr\_brt

```
std::vector<int> vxg::cloud::agent::proto::stream_caps::caps_video_object::vbr_brt
```

Optional: [min:int, max:int, step:int], range of bitrates, kbps.

Definition at line 223 of file caps.h.

# 10.11 vxg::cloud::agent::proto::event config Struct Reference

Event config.

#include <agent-proto/objects/config.h>

 $Collaboration\ diagram\ for\ vxg::cloud::agent::proto::event\_config:$ 

# **Public Member Functions**

- bool name\_eq (const event\_config &r) const
   Is-equal predicate based on event's name only.
- std::string name () const

# **Data Fields**

event\_type event

event: string, event name, see 6.1 Events naming for details

• std::string custom\_event\_name

Custom event name, used if event set to event\_type::ET\_CUSTOM.

· bool active

active: bool, event is active; if not set, corresponding events will not be sent

· bool stream

stream: bool, start stream when event happens

bool snapshot

snapshot: bool, generate snapshot when event happens

· int period

period: optional int, an interval between periodic events, seconds

• event\_caps caps

Event capabilities.

# 10.11.1 Detailed Description

Event config.

Definition at line 778 of file config.h.

# 10.11.2 Member Function Documentation

# 10.11.2.1 caps\_eq()

Is-equal predicate based on event's caps.

**Parameters** 

#### Returns

true Compared configs have equal caps.

false Compared configs have non-equal caps.

Definition at line 818 of file config.h.

# 10.11.2.2 name()

```
std::string vxg::cloud::agent::proto::event_config::name ( ) const [inline]
```

Definition at line 822 of file config.h.

#### 10.11.2.3 name\_eq()

Is-equal predicate based on event's name only.

#### **Parameters**

#### Returns

true Compared configs are for the event with equal names. false Compared configs are for events with non-equal names.

Definition at line 809 of file config.h.

# 10.11.3 Field Documentation

#### 10.11.3.1 active

```
bool vxg::cloud::agent::proto::event_config::active
```

active: bool, event is active; if not set, corresponding events will not be sent

Definition at line 787 of file config.h.

# 10.11.3.2 caps

```
event_caps vxg::cloud::agent::proto::event_config::caps
```

Event capabilities.

Definition at line 802 of file config.h.

#### 10.11.3.3 custom\_event\_name

```
std::string vxg::cloud::agent::proto::event_config::custom_event_name
```

Custom event name, used if event set to event\_type::ET\_CUSTOM.

Definition at line 783 of file config.h.

#### 10.11.3.4 event

```
event_type vxg::cloud::agent::proto::event_config::event
```

event: string, event name, see 6.1 Events naming for details

Definition at line 780 of file config.h.

## 10.11.3.5 period

```
int vxg::cloud::agent::proto::event_config::period
```

period: optional int, an interval between periodic events, seconds

Definition at line 796 of file config.h.

## 10.11.3.6 snapshot

```
\verb|bool vxg::cloud::agent::proto::event\_config::snapshot|\\
```

snapshot: bool, generate snapshot when event happens

Definition at line 793 of file config.h.

### 10.11.3.7 stream

bool vxg::cloud::agent::proto::event\_config::stream

stream: bool, start stream when event happens

Definition at line 790 of file config.h.

The documentation for this struct was generated from the following file:

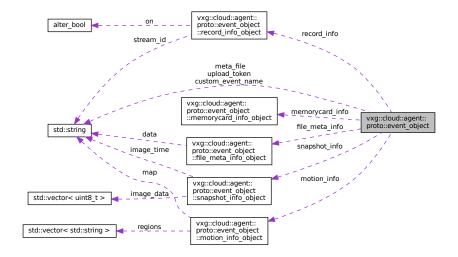

· config.h

# 10.12 vxg::cloud::agent::proto::event\_object Struct Reference

Event object.

#include <agent-proto/objects/config.h>

Collaboration diagram for vxg::cloud::agent::proto::event\_object:

# **Data Structures**

- struct file\_meta\_info\_object
  - meta file info struct
- struct memorycard\_info\_object
  - Memorycard info.
- struct motion\_info\_object
  - Motion info.
- struct record\_info\_object
  - record\_info
- struct snapshot\_info\_object
  - Snapshot info.

# **Public Member Functions**

• std::string name ()

#### **Data Fields**

· snapshot\_info\_object snapshot\_info

Snapshot info.

motion\_info\_object motion\_info

Motion info. Used for ET\_MOTION.

· record\_info\_object record\_info

record info object, used for system event ET\_RECORD

• file\_meta\_info\_object file\_meta\_info

meta file info object, if presented the Cloud will reply with meta file upload URL.

· memorycard\_info\_object memorycard\_info

Memorycard info.

· event\_type event

event: event\_type

• std::string custom\_event\_name

all new custom events should use type event\_type::ET\_CUSTOM, event\_object.custom\_event\_name should be used to specify it's name, this field ignored for standard event types.

· double time

time: float, calendar time, UTC

· uint64 t mediatm

mediatm: optional int, media time stamp to synchronize with media stream

· event\_status status

contains status of event processing (useful when an event implies an ambiguous result of processing) event\_status ← ::ES\_OK - success.

· json meta

meta: optional struct, string key-value mapping with some event metadata (for example, custom data when event is triggered externally or bounding rectangle from face detector)

· bool active

! State for stateful events, not part of the Cloud API yet, used for statefull events state indication.

- · double time\_end
- · std::string upload\_token

! Upload token id, used for memorycard sync API to identify the requested upload.

- · bool upload\_canceler
- std::string meta\_file

! meta\_file: raw metadata in any string format, if set will be uploaded as meta file

· bool state\_dummy

Stateful event emulation flag.

# 10.12.1 Detailed Description

Event object.

Definition at line 517 of file config.h.

# 10.12.2 Member Function Documentation

# 10.12.2.1 name()

```

#### 10.12.3.1 active

```
bool vxg::cloud::agent::proto::event_object::active
```

! State for stateful events, not part of the Cloud API yet, used for statefull events state indication.

Definition at line 660 of file config.h.

#### 10.12.3.2 custom event name

```
std::string vxg::cloud::agent::proto::event_object::custom_event_name
```

all new custom events should use type event\_type::ET\_CUSTOM, event\_object.custom\_event\_name should be used to specify it's name, this field ignored for standard event types.

Definition at line 639 of file config.h.

# 10.12.3.3 event

```
event_type vxg::cloud::agent::proto::event_object::event
```

event: event\_type

Definition at line 635 of file config.h.

#### 10.12.3.4 file\_meta\_info

```
file_meta_info_object vxg::cloud::agent::proto::event_object::file_meta_info
```

meta file info object, if presented the Cloud will reply with meta file upload URL.

Definition at line 623 of file config.h.

#### 10.12.3.5 mediatm

uint64\_t vxg::cloud::agent::proto::event\_object::mediatm

mediatm: optional int, media time stamp to synchronize with media stream

Definition at line 643 of file config.h.

# 10.12.3.6 memorycard\_info

memorycard\_info\_object vxg::cloud::agent::proto::event\_object::memorycard\_info

Memorycard info.

Used for ET\_MEMORYCARD event.

Definition at line 630 of file config.h.

#### 10.12.3.7 meta

```
json vxg::cloud::agent::proto::event_object::meta
```

meta: optional struct, string key-value mapping with some event metadata (for example, custom data when event is triggered externally or bounding rectangle from face detector)

Definition at line 656 of file config.h.

### 10.12.3.8 meta\_file

```
std::string vxg::cloud::agent::proto::event_object::meta_file
```

! meta\_file: raw metadata in any string format, if set will be uploaded as meta file

Definition at line 673 of file config.h.

#### 10.12.3.9 motion\_info

```
motion_info_object vxg::cloud::agent::proto::event_object::motion_info
```

Motion info. Used for ET\_MOTION.

Definition at line 618 of file config.h.

# 10.12.3.10 record\_info

```
record_info_object vxg::cloud::agent::proto::event_object::record_info
```

record info object, used for system event ET\_RECORD

Definition at line 620 of file config.h.

#### 10.12.3.11 snapshot\_info

```
snapshot_info_object vxg::cloud::agent::proto::event_object::snapshot_info
```

Snapshot info.

Definition at line 616 of file config.h.

# 10.12.3.12 state\_dummy

```
bool vxg::cloud::agent::proto::event_object::state_dummy
```

Stateful event emulation flag.

If set this event object is not real event but state dummy event used to emulate state on the Cloud.

Definition at line 677 of file config.h.

#### 10.12.3.13 status

```
event_status vxg::cloud::agent::proto::event_object::status
```

contains status of event processing (useful when an event implies an ambiguous result of processing) event\_← status::ES\_OK - success.

Default value; event\_status::ES\_ERROR – camera couldn't process the event well (for example making a snapshot has been failed). More details can be obtained from field error\_description; error\_description: optional string, contains description of the problem in case of unsuccessful processing of the event

Definition at line 652 of file config.h.

#### 10.12.3.14 time

double vxg::cloud::agent::proto::event\_object::time

time: float, calendar time, UTC

Definition at line 641 of file config.h.

# 10.14 vxg::cloud::agent::event\_stream Class Reference

Event stream, abstract class for event generation.

#include <agent/event-stream.h>

# **Public Types**

typedef std::shared\_ptr< event\_stream > ptr
 std::shared\_ptr to event\_stream

#### **Public Member Functions**

event\_stream ( std::string name)

Construct a new event stream object.

- virtual ~event stream ()
- bool notify (proto::event\_object event)

Callback should be called to notify event.

virtual bool start ()=0

Start events generation, called by internal code when the events generation requested by the VXG Cloud.

• virtual void stop ()=0

Stop events generation.

virtual bool get events ( std::vector < proto::event config > &configs)=0

Get the events configs list This method should update config object and add all configurations for the events provided by this event stream.

virtual bool set\_events (const std::vector< proto::event\_config > &config)=0

Set the events configuration.

virtual bool trigger\_event (proto::event\_object &event)

Trigger event provided by event\_stream If get\_events() returned event config with proto::event\_config.caps.trigger == true and this event was triggered via the Cloud API this method will be called.

virtual bool set\_trigger\_recording (bool enabled, int pre, int post)=0

Turn on/off the event\_stream triggered recording and pre/post recording time.

- virtual bool init ()=0
- virtual void finit ()=0

# 10.14.1 Detailed Description

Event stream, abstract class for event generation.

Definition at line 14 of file event-stream.h.

# 10.14.2 Member Typedef Documentation

```
10.14.2.1 ptr
```

```
typedef std::shared_ptr<event_stream> vxg::cloud::agent::event_stream::ptr
```

std::shared\_ptr to event\_stream

Definition at line 25 of file event-stream.h.

# 10.14.3 Constructor & Destructor Documentation

#### 10.14.3.1 event stream()

Construct a new event stream object.

#### **Parameters**

in	name	Event stream name, unique name for event stream
----	------	---

Definition at line 31 of file event-stream.h.

# 10.14.3.2 ~event\_stream()

```
virtual vxg::cloud::agent::event_stream::~event_stream ( ) [inline], [virtual]
```

Definition at line 33 of file event-stream.h.

#### 10.14.4 Member Function Documentation

#### 10.14.4.1 finit()

```
virtual void vxg::cloud::agent::event_stream::finit ( ) [pure virtual]
```

# 10.14.4.2 get\_events()

Get the events configs list This method should update config object and add all configurations for the events provided by this event stream.

config may already include event configs reported by this get\_event(), hence the implementation should consider this and do not include its event configs more than one time.

#### **Parameters**

out	configs	Events configurations.
-----	---------	------------------------

## Returns

true configs is valid.

false configs is invalid, should not be applied.

#### Note

This method MUST always return the configs with the same caps, otherwise the new config will not be applied by the library.

#### 10.14.4.3 init()

```
virtual bool vxg::cloud::agent::event_stream::init ( ) [pure virtual]
```

## 10.14.4.4 notify()

Callback should be called to notify event.

#### **Parameters**

in	event	Event object
----	-------	--------------

#### Returns

true Event successfully notified false Notification failed

Definition at line 46 of file event-stream.h.

#### 10.14.4.5 set\_events()

Set the events configuration.

# **Parameters**

config Events configurations list which includes all events reported by the system and other event streams, implementation should find own event configurations and apply them.

#### Returns

```
true config applied.
false config not applied.
```

# 10.14.4.6 set\_trigger\_recording()

Turn on/off the event\_stream triggered recording and pre/post recording time.

Triggered recording means that event generated by this event\_stream should start recording. Final recorded file should have duration of pre time + duration of the even + post time.

#### Note

Trigger driven recording can be used if platform supports such type of recording, implementation of such type of recording should include specific agent::media::stream records exporting mechanism which handles two consecutive events pre/post time intersections.

#### **Parameters**

in	enabled	true if event stream should trigger the recording. Implementation may ignore this if not trigger driven record method is used.	
in	pre	e Pre recording time in milliseconds.	
in	post Post recording time in milliseconds.		

#### Returns

true

false

#### 10.14.4.7 start()

```
virtual bool vxg::cloud::agent::event_stream::start ( ) [pure virtual]
```

Start events generation, called by internal code when the events generation requested by the VXG Cloud.

Event stream MUST immediately notify states of all stateful events after the start() was invoked.

#### Returns

true Events generation started false Failed to start events generation

#### 10.14.4.8 stop()

```
virtual void vxg::cloud::agent::event_stream::stop ( ) [pure virtual]
```

Stop events generation.

#### 10.14.4.9 trigger\_event()

Trigger event provided by event\_stream If get\_events() returned event config with proto::event\_config.caps.trigger == true and this event was triggered via the Cloud API this method will be called.

The logic of this method should be the same as for vxg::cloud::agent::callback::on\_trigger\_event().

#### See also

vxg::cloud::agent::callback::on\_trigger\_event()

#### **Parameters**

event

## Returns

true

false

Definition at line 103 of file event-stream.h.

The documentation for this class was generated from the following file:

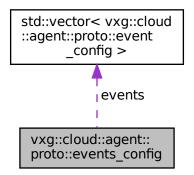

· event-stream.h

# 10.15 vxg::cloud::agent::proto::events\_config Struct Reference

Events config, list of event\_config objects.

#include <agent-proto/objects/config.h>

Collaboration diagram for vxg::cloud::agent::proto::events\_config:

# **Public Member Functions**

bool get\_event\_config (const event\_object &event, event\_config &result)
 Finds event which corresponds to event\_config arg in the events\_config structure.

# **Data Fields**

bool enabled

enabled: bool, indicates global events and event-driven streaming enabling flag

std::vector < event\_config > events
 events: list of event\_config struct

# 10.15.1 Detailed Description

Events config, list of event\_config objects.

Definition at line 867 of file config.h.

# 10.15.2 Member Function Documentation

# 10.15.2.1 get\_event\_config()

Finds event which corresponds to event\_config arg in the events\_config structure.

# **Parameters**

in	event	- event_object, event_object.event used to find the event_config	
out	result	- if event_config found it will be storred here	

#### Returns

true event found

false event not found

Definition at line 884 of file config.h.

# 10.15.3 Field Documentation

#### 10.15.3.1 enabled

bool vxg::cloud::agent::proto::events\_config::enabled

enabled: bool, indicates global events and event-driven streaming enabling flag

Definition at line 870 of file config.h.

# 10.15.3.2 events

std::vector<event\_config> vxg::cloud::agent::proto::events\_config::events

events: list of event\_config struct

Definition at line 873 of file config.h.

The documentation for this struct was generated from the following file:

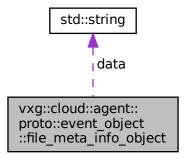

config.h

# 10.16 vxg::cloud::agent::proto::event\_object::file\_meta\_info\_object Struct Reference

meta file info struct

# 10.17 vxg::media::Streamer::ISink Class Reference

#include <streamer/base\_streamer.h>

Inheritance diagram for vxg::media::Streamer::ISink:

# **Public Types**

typedef std::shared\_ptr< ISink > ptr

std::shared\_ptr alias

typedef std::unique\_ptr< |Sink > PtrU

**std::unique\_ptr** alias

# **Public Member Functions**

• ISink (uint8\_t prio=SINK\_THREAD\_PRIO)

Construct a new ISink object.

- virtual ~ISink ()
- virtual bool init ( std::string url="")=0

Init sink.

• virtual bool finit ()=0

Deinit sink.

virtual bool process ( std::shared\_ptr< MediaFrame > frame)=0

Process next media frame.

• virtual bool droppable ()=0

If sink of with dropping its media frames.

virtual bool negotiate ( std::vector< Streamer::StreamInfo > info)

Negotiation callback, this method called with collected from the ISource::negotiate media stream description.

• virtual void error (StreamError error)=0

Media processing error callback, called when ISink::process returned false or linked source's ISource::pullFrame returned false, or when ISource::error was called.

• virtual std::string name ()=0

Sink name.

- void set\_eos\_cb ( std::function < void() > eos\_cb)
- void set\_eos (bool eos)

# 10.17.1 Detailed Description

Definition at line 497 of file base\_streamer.h.

#### 10.17.2.2 PtrU

```
typedef std::unique_ptr<ISink> vxg::media::Streamer::ISink::PtrU
```

std::unique\_ptr alias

Definition at line 499 of file base\_streamer.h.

# 10.17.3 Constructor & Destructor Documentation

## 10.17.3.1 ISink()

Construct a new ISink object.

#### **Parameters**

```
prio internall thread priority, used on RTOS.
```

Definition at line 504 of file base\_streamer.h.

# 10.17.3.2 ∼ISink()

```
virtual vxg::media::Streamer::ISink::~ISink ( ) [inline], [virtual]
```

Definition at line 510 of file base\_streamer.h.

# 10.17.4 Member Function Documentation

# 10.17.4.1 droppable()

```
virtual bool vxg::media::Streamer::ISink::droppable ( ) [pure virtual]
```

If sink of with dropping its media frames.

# Returns

true Internal media thread allowed to drop frames if internal media queue is full. false No media frames dropping allowed.

Implemented in vxg::media::rtmp\_sink, and vxg::media::ffmpeg::Sink.

# 10.17.4.2 error()

Media processing error callback, called when ISink::process returned false or linked source's ISource::pullFrame returned false, or when ISource::error was called.

#### **Parameters**

```
error Error type.
```

Implemented in vxg::media::rtmp\_sink, and vxg::media::ffmpeg::Sink.

# 10.17.4.3 finit()

```
virtual bool vxg::media::Streamer::ISink::finit ( ) [pure virtual]
```

Deinit sink.

#### Returns

true finit success.

false finit failed.

Implemented in vxg::media::ffmpeg::Sink.

# 10.17.4.4 init()

Init sink.

### **Parameters**

```
in url Url if needed.
```

# Returns

true init success.

false init failed.

Implemented in vxg::media::ffmpeg::Sink, and vxg::media::rtmp\_sink.

# 10.17.4.5 name()

```
virtual std::string vxg::media::Streamer::ISink::name ( ) [pure virtual]
```

Sink name.

#### Returns

## std::string

Implemented in vxg::media::rtmp\_sink, and vxg::media::ffmpeg::Sink.

## 10.17.4.6 negotiate()

Negotiation callback, this method called with collected from the ISource::negotiate media stream description.

#### **Parameters**

```
info List of elementary streams descriptions.
```

## Returns

true If streams descriptions accepted.

false Streams not accepted, will cause media thread stopping.

Reimplemented in vxg::media::ffmpeg::Sink, and vxg::media::rtmp\_sink.

Definition at line 557 of file base streamer.h.

#### 10.17.4.7 process()

Process next media frame.

Internal function called by media thread, the last function of media frame travel. Final class process frame in this function: sends to server, writes on disk etc.

## **Parameters**

in	frame	Media frame.

#### Returns

true Media frame successfully processed.

false Media frame processing failed.

#### 10.17.4.8 set\_eos()

Definition at line 662 of file base\_streamer.h.

## 10.17.4.9 set\_eos\_cb()

Definition at line 660 of file base\_streamer.h.

The documentation for this class was generated from the following file:

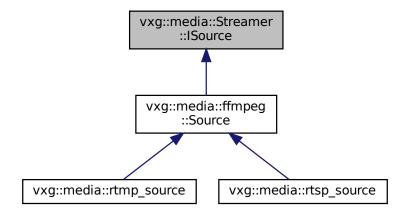

· base streamer.h

## 10.18 vxg::media::Streamer::ISource Class Reference

ISource interface class.

```
#include <streamer/base_streamer.h>
```

Inheritance diagram for vxg::media::Streamer::ISource:

## **Public Types**

• enum Mode { PULL, PUSH }

Source operation mode.

typedef std::shared\_ptr< |Source > ptr

#### **Public Member Functions**

• ISource (uint8\_t \_prio=SRC\_THREAD\_PRIO, Mode \_mode=PULL, bool drop=true)

Construct a new ISource object.

• virtual bool init ( std::string url="")=0

Init source.

virtual void finit ()=0

Finit souce.

virtual void error (StreamError stream\_error)

Error notification.

virtual std::vector< Streamer::StreamInfo > negotiate ()=0

Negotiation callback.

virtual std::shared\_ptr< MediaFrame > pullFrame ()=0

Main method of the Mode::PULL mode data producing.

• virtual std::string name ()=0

Source class name.

void pushFrame ( std::shared\_ptr< MediaFrame > frame)

Implementation should call this method to provide media frames in the Mode::PUSH source operation mode.

## **Protected Attributes**

· Mode mode\_

## 10.18.1 Detailed Description

ISource interface class.

Definition at line 685 of file base\_streamer.h.

## 10.18.2 Member Typedef Documentation

```
10.18.2.1 ptr
```

```
typedef std::shared_ptr<ISource> vxg::media::Streamer::ISource::ptr
```

Definition at line 690 of file base\_streamer.h.

## 10.18.3 Member Enumeration Documentation

## 10.18.3.1 Mode

```
enum vxg::media::Streamer::ISource::Mode
```

Source operation mode.

#### Enumerator

PULL	Pull mode. The ISource::pullFrame() will be called from the separate thread. User should implement it and return std::shared_ptr <mediaframe>.</mediaframe>
PUSH	Push mode. Inherited class should feed media data on its own by calling the ISource::pushFrame() method with MediaFrame object passed as argument.

Definition at line 692 of file base\_streamer.h.

## 10.18.4 Constructor & Destructor Documentation

## 10.18.4.1 | ISource()

Construct a new ISource object.

## **Parameters**

in	_prio	Push thread priority. Used if _mode is Mode::PUSH.
in	_mode	Source operating mode.
in	drop	If true he media frames may be dropped if queue is full.

Definition at line 708 of file base\_streamer.h.

## 10.18.5 Member Function Documentation

## 10.18.5.1 error()

Error notification.

Calling this method will inform media thread and all sinks about error happened in the source.

#### **Parameters**

in	stream_error	

Definition at line 743 of file base\_streamer.h.

#### 10.18.5.2 finit()

```
virtual void vxg::media::Streamer::ISource::finit ( ) [pure virtual]
```

Finit souce.

Implemented in vxg::media::ffmpeg::Source.

## 10.18.5.3 init()

Init source.

#### **Parameters**

```
url Url if needed.
```

#### Returns

true Init success.

false Init failed.

Implemented in vxg::media::ffmpeg::Source, vxg::media::rtsp\_source, and vxg::media::rtmp\_source.

## 10.18.5.4 name()

```
virtual std::string vxg::media::Streamer::ISource::name ( ) [pure virtual]
```

Source class name.

Returns

## std::string

Implemented in vxg::media::rtsp\_source, and vxg::media::ffmpeg::Source.

#### 10.18.5.5 negotiate()

```
virtual std::vector<Streamer::StreamInfo> vxg::media::Streamer::ISource::negotiate ( ) [pure
virtual]
```

Negotiation callback.

Called by internals. Class implementation should return the list of the streams info source will be producing for the sinks, this list will be then passed to the ISink::negotiate method.

#### Returns

```
std::vector<Streamer::StreamInfo>
```

Implemented in vxg::media::ffmpeg::Source.

## 10.18.5.6 pullFrame()

```
virtual std::shared_ptr<MediaFrame> vxg::media::Streamer::ISource::pullFrame ( ) [pure virtual]
```

Main method of the Mode::PULL mode data producing.

Called by internals if the source operation mode is Mode::PULL. Implementation should return media frame object with correctly filled fields.

#### Returns

```
std::shared_ptr<MediaFrame>
```

Implemented in vxg::media::ffmpeg::Source.

## 10.18.5.7 pushFrame()

Implementation should call this method to provide media frames in the Mode::PUSH source operation mode.

#### **Parameters**

frame	smart pointer to MediaFrame.

Definition at line 843 of file base\_streamer.h.

#### 10.18.6 Field Documentation

#### 10.18.6.1 mode\_

```
Mode vxg::media::Streamer::ISource::mode_ [protected]
```

Definition at line 980 of file base\_streamer.h.

The documentation for this class was generated from the following file:

# 10.19 vxg::logger Class Reference

Logger class, current implementation based on spdlog.

```
#include <utils/logging.h>
```

#### **Data Structures**

struct options

## **Public Types**

```
enum loglevel {lvl_crit, lvl_off, lvl_error, lvl_warn,lvl_info, lvl_debug, lvl_trace }
```

 $\bullet \ \ \mathsf{typedef} \ \ \mathbf{std::shared\_ptr} < \mathsf{spdlog::logger} > \underline{\mathsf{logger\_ptr}}$ 

## **Static Public Member Functions**

• static **std::shared\_ptr**< spdlog::logger > instance ( **std::string** name)

Get pointer to the instance of the named spdlog::logger object.

• static void reset (int argc, char \*\*argv, loglevel I, std::string syslog\_ident="VXGCloudAgentDefault", std ::string crash\_logfile\_path="", std::string logfile\_path="", size\_t logfile\_max\_size=(1024 \*1024), size\_ ← t logfile max files=3)

Reset default logger parameters.

- static void reset (const options &opts)
- static void set\_level (logger\_ptr log\_ptr, loglevel lvl)

Change the logger object loglevel.

template < typename FormatString, typename... Args >
 static void info (const FormatString &fmt, const Args &... args)
 Static info log.

 template < typename FormatString, typename... Args> static void error (const FormatString &fmt, const Args &... args)

- template < typename FormatString, typename... Args > static void warn (const FormatString &fmt, const Args &... args)
- template<typename FormatString, typename... Args> static void debug (const FormatString &fmt, const Args &... args)
- template<typename FormatString , typename... Args> static void trace (const FormatString &fmt, const Args &... args)
- template<typename T >
   static void trace (const T &msg)
- template<typename T >
   static void debug (const T &msg)

   static void warn (const T &msg)
- template<typename T >
   static void error (const T &msg)

## 10.19.1 Detailed Description

Logger class, current implementation based on spdlog.

Definition at line 22 of file logging.h.

## 10.19.2 Member Typedef Documentation

#### 10.19.2.1 logger\_ptr

```
typedef std::shared_ptr<spdlog::logger> vxg::logger::logger_ptr
```

Definition at line 24 of file logging.h.

## 10.19.3 Member Enumeration Documentation

#### 10.19.3.1 loglevel

```
enum vxg::logger::loglevel
```

#### Enumerator

lvl_crit	
lvl_off	
lvl_error	
lvl_warn	
lvl_info	
lvl debug	

lvl\_trace

Definition at line 25 of file logging.h.

#### 10.19.4 Member Function Documentation

## 10.19.4.1 debug() [1/2]

Definition at line 276 of file logging.h.

## 10.19.4.2 debug() [2/2]

Definition at line 289 of file logging.h.

## 10.19.4.3 error() [1/2]

Definition at line 268 of file logging.h.

## 10.19.4.4 error() [2/2]

Definition at line 304 of file logging.h.

## 10.19.4.5 info() [1/2]

Static info log.

## **Template Parameters**

FormatString	
Args	

#### **Parameters**

fmt	
args	

Definition at line 264 of file logging.h.

## 10.19.4.6 info() [2/2]

Definition at line 294 of file logging.h.

## 10.19.4.7 instance()

Get pointer to the instance of the named spdlog::logger object.

On the very first call creates default logger named 'default'. Contructs new logger if logger with such name was never requested

#### **Parameters**

in	name	Logger name. If logger with such name was already created, then it will be reused, otherwise a	
		new one will be constructed.	

## Returns

std::shared\_ptr<spdlog::logger>

Definition at line 186 of file logging.h.

#### 10.19.4.8 reset() [1/2]

Definition at line 233 of file logging.h.

## 10.19.4.9 reset() [2/2]

```
static void vxg::logger::reset (
    int argc,
    char ** argv,
    loglevel 1,
    std::string syslog_ident = "VXGCloudAgentDefault",
    std::string crash_logfile_path = "",
    std::string logfile_path = "",
    size_t logfile_max_size = (1024 * 1024),
    size_t logfile_max_files = 3 ) [inline], [static]
```

Reset default logger parameters.

Used to change all loggers parameters such as syslog/file sinks usage. Should be called before very first logger::instance() call to take effect. If wasn't called the default console logging sink only will be used for all loggers.

## **Deprecated** Use reset(const options& opts)

#### **Parameters**

argc	Process argc
argv	Process argv
1	default loglevel, all loggers will be created with this loglevel, can be overriden with SPDLOG_LEVEL env variable
syslog_ident	Syslog identification string, if empty syslog logging will be disabled.
logfile_path	Rotating plain log file path, if empty no plain log file will be used.
logfile_max_size	Max log file size before invoking logrotate.
logfile_max_files	Max number if rotating logfiles.

Definition at line 214 of file logging.h.

## 10.19.4.10 set\_level()

Change the logger object loglevel.

#### **Parameters**

log_ptr	Logger object pointer.
lvl	New loglevel.

Definition at line 253 of file logging.h.

## 10.19.4.11 trace() [1/2]

Definition at line 280 of file logging.h.

## 10.19.4.12 trace() [2/2]

Definition at line 284 of file logging.h.

## 10.19.4.13 warn() [1/2]

Definition at line 272 of file logging.h.

## 10.19.4.14 warn() [2/2]

Definition at line 299 of file logging.h.

The documentation for this class was generated from the following file:

## 10.20.1 Detailed Description

VXG Cloud agent manager class.

Definition at line 31 of file manager.h.

## 10.20.2 Member Typedef Documentation

#### 10.20.2.1 ptr

```
typedef std::shared_ptr<manager> vxg::cloud::agent::manager::ptr
shared_ptr to manager object
```

Definition at line 449 of file manager.h.

## 10.20.3 Member Function Documentation

```
10.20.3.1 __notify_record_event()
```

#### 10.20.3.2 \_\_trigger\_periodic\_event()

## 10.20.3.3 \_append\_internal\_custom\_events()

```
\begin{tabular}{ll} void vxg::cloud::agent::manager::\_append\_internal\_custom\_events \end{tabular} ( \\ proto::events\_config \& config ) \end{tabular} [protected]
```

## 10.20.3.4 \_cancel\_direct\_uploads\_by\_ticket()

## 10.20.3.5 \_cancel\_periodic\_event()

## 10.20.3.6 \_cancel\_periodic\_events()

## 10.20.3.7 \_current\_delivery\_mode()

```
event_state::stream_delivery_mode vxg::cloud::agent::manager::_current_delivery_mode ( ) [protected]
```

## 10.20.3.8 \_handle\_stream\_stateful\_event()

#### 10.20.3.9 \_handle\_stream\_stateless\_event()

## 10.20.3.10 init events states()

## 10.20.3.11 \_load\_events\_configs()

#### 10.20.3.12 \_lookup\_event\_stream()

```
10.20.3.13 _lookup_event_stream_by_event()
```

```
event_stream::ptr vxg::cloud::agent::manager::_lookup_event_stream_by_event (
            const proto::event_object & event ) [protected]
10.20.3.14 _request_direct_upload_snapshot()
bool vxg::cloud::agent::manager::_request_direct_upload_snapshot (
             proto::get_direct_upload_url direct_upload ) [protected]
10.20.3.15 _request_direct_upload_video()
\verb|bool vxg::cloud::agent::manager::\_request\_direct\_upload\_video | (
             proto::get_direct_upload_url direct_upload ) [protected]
10.20.3.16 schedule direct upload()
bool vxg::cloud::agent::manager::_schedule_direct_upload (
             proto::get_direct_upload_url get_upload_url ) [protected]
10.20.3.17 _schedule_periodic_event()
void vxg::cloud::agent::manager::_schedule_periodic_event (
             const proto::event_config & event_conf ) [protected]
10.20.3.18 _schedule_periodic_events()
\verb"void vxg::cloud::agent::manager::\_schedule\_periodic\_events \ (
             proto::events_config & events_conf ) [protected]
10.20.3.19 _stop_all_event_streams()
```

void vxg::cloud::agent::manager::\_stop\_all\_event\_streams ( ) [protected]

```
10.20.3.20 _stop_all_streams()
void vxg::cloud::agent::manager::_stop_all_streams ( ) [protected]
Streams helpers.
10.20.3.21 _stop_stream()
void vxg::cloud::agent::manager::_stop_stream (
             agent::media::stream::ptr s ) [protected]
10.20.3.22 _update_direct_upload_queue_latency()
void vxg::cloud::agent::manager::_update_direct_upload_queue_latency ( ) [protected]
10.20.3.23 _update_event_stream_configs()
\verb|bool vxg::cloud::agent::manager::_update_event\_stream\_configs (|
            const std::string & stream_name,
             const std::vector< proto::event_config > & new_configs ) [protected]
10.20.3.24 _update_events_configs()
bool vxg::cloud::agent::manager::_update_events_configs (
            const std::vector< proto::event_config > & new_configs,
              std::vector< proto::event_config > & dest_configs ) [protected]
10.20.3.25 _update_storage_status()
bool vxg::cloud::agent::manager::_update_storage_status ( ) [protected]
10.20.3.26 create()
static manager::ptr vxg::cloud::agent::manager::create (
             callback::ptr callback,
             proto::access_token::ptr access_token,
              std::vector< agent::media::stream::ptr > media_streams,
              std::vector< event_stream::ptr > event_streams = std::vector< event_stream::ptr > (0)
) [static]
Create manager object.
```

#### **Parameters**

in	callback	cm::callback object, should not be null
in	access_token	VXG Cloud access token
in	media_streams	List of std::shared_ptr to base_stream derived objects. Should have at least one element. base_stream is abstract class so you need to declare you own class derived from the base_stream or use one of the provided classes (rtsp_stream,), basically each stream is for example one rtsp stream provided by the device. Each media stream device has should be represented as a separate base_stream derived object, currently only two streams per device are supported by the VXG Cloud.
in	event_streams	List of event_stream::ptr, can be empty. event_stream is abstract class so final implementation should use own class derived from the event_stream.

## Returns

manager::ptr

## 10.20.3.27 direct\_upload\_sync\_cb()

bool vxg::cloud::agent::manager::direct\_upload\_sync\_cb ( ) [protected]

## 10.20.3.28 handle\_event\_meta\_file()

## 10.20.3.29 handle\_event\_snapshot()

## 10.20.3.30 handle\_stream\_event()

```
10.20.3.31 lookup_stream()
```

```
agent::media::stream::ptr vxg::cloud::agent::manager::lookup_stream (
             std::string name ) [protected]
10.20.3.32 notify_event()
bool vxg::cloud::agent::manager::notify_event (
            proto::event_object event ) [protected]
10.20.3.33 on_audio_file_play()
virtual bool vxg::cloud::agent::manager::on_audio_file_play (
             std::string url ) [protected], [virtual]
10.20.3.34 on_cam_memorycard_synchronize()
virtual bool vxg::cloud::agent::manager::on_cam_memorycard_synchronize (
             proto::command::cam_memorycard_synchronize_status & synchronize_status,
            vxg::cloud::time start,
            vxg::cloud::time end ) [protected], [virtual]
10.20.3.35 on_cam_memorycard_synchronize_cancel()

10.20.3.69 on_set_wifi_config()
virtual bool vxg::cloud::agent::manager::on_set_wifi_config (
            const proto::wifi_network & config ) [protected], [virtual]
10.20.3.70 on_start_backward()
virtual bool vxg::cloud::agent::manager::on_start_backward (
              std::string & url ) [protected], [virtual]
10.20.3.71 on_stop_backward()
virtual bool vxg::cloud::agent::manager::on_stop_backward (
              std::string & url ) [protected], [virtual]
```

#### 10.20.3.72 on\_stream\_start()

## 10.20.3.73 on\_stream\_stop()

## 10.20.3.74 on\_trigger\_event()

## 10.20.3.75 on\_update\_preview()

## 10.20.3.76 start()

```
bool vxg::cloud::agent::manager::start ( )
```

Start internal workflow, this is the main function which starts all internal threads and connections.

#### Returns

true started

false start failed

#### 10.20.3.77 stop()

```
void vxg::cloud::agent::manager::stop ( )
```

Stop manager, disconnect from the VXG Cloud.

# 10.22 vxg::media::Streamer::MediaFrame Struct Reference

Media frame container.

```
#include <streamer/base_streamer.h>
```

Collaboration diagram for vxg::media::Streamer::MediaFrame:

## **Public Member Functions**

bool operator< (const MediaFrame &rv)</li>

Two frames comparation using timestamps.

## **Data Fields**

std::vector< uint8\_t > data

Media frame data.

• size\_t len

Media frame data length.

int64\_t pts

Media frame timestamp in timescale that corresponds to timescale.

int64 t dts

Media frame decoding timestamp in timescale that corresponds to timescale.

int64\_t duration

Media frame duration if needed.

bool is\_key

Is key frame flag.

MediaType type

Media frame type.

• std::pair < int, int > timescale

Timescale of pts and duration. ex.: 1/90000, 1/1000 etc.

• int64\_t time\_realtime

Real time if available from source, for ex.

#### **Static Public Attributes**

• static constexpr int64\_t NO\_PTS

## 10.22.1 Detailed Description

Media frame container.

Definition at line 403 of file base\_streamer.h.

#### 10.22.2 Member Function Documentation

## 10.22.2.1 operator<()

Two frames comparation using timestamps.

**Parameters** 

```
rv Right value
```

Returns

true

false

Definition at line 421 of file base\_streamer.h.

## 10.22.3 Field Documentation

## 10.22.3.1 data

```
std::vector<uint8_t> vxg::media::Streamer::MediaFrame::data
```

Media frame data.

Definition at line 426 of file base streamer.h.

## 10.22.3.2 dts

```
int64_t vxg::media::Streamer::MediaFrame::dts
```

Media frame decoding timestamp in timescale that corresponds to timescale.

Definition at line 433 of file base\_streamer.h.

## 10.22.3.3 duration

```
int64_t vxg::media::Streamer::MediaFrame::duration
```

Media frame duration if needed.

Definition at line 435 of file base\_streamer.h.

### 10.22.3.4 is\_key

```
bool vxg::media::Streamer::MediaFrame::is_key
```

Is key frame flag.

Definition at line 437 of file base\_streamer.h.

## 10.22.3.5 len

```
size_t vxg::media::Streamer::MediaFrame::len
```

Media frame data length.

Definition at line 428 of file base\_streamer.h.

#### 10.22.3.6 NO\_PTS

```
constexpr int64_t vxg::media::Streamer::MediaFrame::NO_PTS [static], [constexpr]
```

Definition at line 423 of file base\_streamer.h.

#### 10.22.3.7 pts

```
int64_t vxg::media::Streamer::MediaFrame::pts
```

Media frame timestamp in timescale that corresponds to timescale.

Definition at line 430 of file base\_streamer.h.

#### 10.22.3.8 time\_realtime

```
int64_t vxg::media::Streamer::MediaFrame::time_realtime
```

Real time if available from source, for ex.

pts based on NTP time from RTCP SR

Definition at line 444 of file base streamer.h.

#### 10.22.3.9 timescale

```
std::pair<int, int> vxg::media::Streamer::MediaFrame::timescale
```

Timescale of pts and duration. ex.: 1/90000, 1/1000 etc.

Definition at line 441 of file base\_streamer.h.

## 10.22.3.10 type

```
MediaType vxg::media::Streamer::MediaFrame::type
```

Media frame type.

Definition at line 439 of file base\_streamer.h.

base\_streamer.h

# 10.23 vxg::cloud::agent::proto::event\_object::memorycard\_info\_object Struct Reference

Memorycard info.

#include <agent-proto/objects/config.h>

#### **Data Fields**

• memorycard\_status status

status

• uint64\_t size

memorycard size in MBs

· uint64\_t free

memorycard free space in MBs

int max sync duration

optional int, Max duration that can be requested for storages sync operation .

## 10.23.1 Detailed Description

Memorycard info.

Definition at line 580 of file config.h.

#### 10.23.2 Field Documentation

## 10.23.2.1 free

uint64\_t vxg::cloud::agent::proto::event\_object::memorycard\_info\_object::free

memorycard free space in MBs

Definition at line 586 of file config.h.

## 10.23.2.2 max\_sync\_duration

int vxg::cloud::agent::proto::event\_object::memorycard\_info\_object::max\_sync\_duration

optional int, Max duration that can be requested for storages sync operation .

0 means - sync is not supported (default value when parameter is missed). null - unlimited duration can be requested. Should be included: the first event right after connection

Definition at line 591 of file config.h.

#### 10.23.2.3 size

uint64\_t vxg::cloud::agent::proto::event\_object::memorycard\_info\_object::size

memorycard size in MBs

Definition at line 584 of file config.h.

#### 10.23.2.4 status

memorycard\_status vxg::cloud::agent::proto::event\_object::memorycard\_info\_object::status

status

Definition at line 582 of file config.h.

#### 10.26.2.2 regions

std::vector< std::string> vxg::cloud::agent::proto::event\_object::motion\_info\_object::regions

regions: optional list of string, names of regions where motion is detected

Definition at line 559 of file config.h.

The documentation for this struct was generated from the following file:

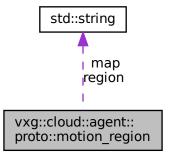

config.h

# 10.27 vxg::cloud::agent::proto::motion\_region Struct Reference

Motion detection related structs.

#include <agent-proto/objects/config.h>

Collaboration diagram for vxg::cloud::agent::proto::motion\_region:

#### **Data Fields**

· std::string region

Mandatory: name of region if supported by camera.

std::string map

Mandatory: String is packed with Apple Packbit algorithm and after that encoded with Base64.

· size t sensitivity

Mandatory: range 0-100; 0 - minimal sensitivity.

• bool enabled

Mandatory: indicates that motion detection is enabled for the region.

# 10.27.1 Detailed Description

Motion detection related structs.

Motion region

Definition at line 243 of file config.h.

#### 10.27.2 Field Documentation

# 10.27.2.1 enabled

```
bool vxg::cloud::agent::proto::motion_region::enabled
```

Mandatory: indicates that motion detection is enabled for the region.

Definition at line 265 of file config.h.

#### 10.27.2.2 map

```
std::string vxg::cloud::agent::proto::motion_region::map
```

Mandatory: String is packed with Apple Packbit algorithm and after that encoded with Base64.

Bitstring where "1" denotes an active cell and a "0" an inactive cell. The first cell is in the upper left corner. Then the cell order goes first from left to right and then from up to down. If the number of cells is not a multiple of 8 the last byte is padded with zeros.

Definition at line 255 of file config.h.

#### 10.27.2.3 region

```
std::string vxg::cloud::agent::proto::motion_region::region
```

Mandatory: name of region if supported by camera.

Definition at line 246 of file config.h.

#### 10.27.2.4 sensitivity

```
size_t vxg::cloud::agent::proto::motion_region::sensitivity
```

Mandatory: range 0-100; 0 - minimal sensitivity.

If sensitivity is supported only for whole frame, the same value should be used for all regions.

Definition at line 261 of file config.h.

# 10.29 vxg::cloud::agent::proto::osd\_caps Struct Reference

OSD capabilities.

#include <agent-proto/objects/caps.h>

Collaboration diagram for vxg::cloud::agent::proto::osd caps:

#### **Data Fields**

bool system\_id

system\_id: bool, True when OSD supports separate system\_id enabling/disabling

bool system\_id\_text

system\_id\_text: bool, True when OSD supports separate system\_id customization

bool time

time: bool, True when OSD supports separate time enabling/disabling

• std::vector< time\_format\_n > time\_format

time\_format: list of string, supported time formats.

bool date

date: bool, True when OSD supports separate date enabling/disabling

std::vector< std::string > date\_format

date\_format: list of string, supported date formats.

std::vector< std::string > font\_size

font\_size: list of string, describes supported font sizes.

 $\bullet \ \ \text{std::vector} < \ \text{std::pair} < \ \text{std::string}, \ \ \text{std::string} > > \ \text{font\_color}$ 

font\_color: list of pairs [string (name), optional string (value)], predefined set of possible font colors.

 $\bullet \quad \text{std::vector} < \ \text{std::string}, \ \ \text{std::string} >> \ \text{bkg\_color}$ 

bkg\_color: list of pairs [string (name), optional string (value)], predefined set of possible background colors.

bool bkg\_transp

bkg\_transp: bool, True when OSD supports background transparency

std::vector< std::string > alignment

alignment: list of strings, supported OSD positions.

# 10.29.1 Detailed Description

OSD capabilities.

Definition at line 615 of file caps.h.

#### 10.29.2 Field Documentation

#### 10.29.2.1 alignment

```
std::vector< std::string> vxg::cloud::agent::proto::osd_caps::alignment
```

alignment: list of strings, supported OSD positions.

Empty list means - position can't be changed. Example: ["UpperLeft", "UpperRight", "LowerLeft", "LowerRight"]

Definition at line 654 of file caps.h.

#### 10.29.2.2 bkg\_color

```
std::vector< std::pair< std::string, std::string> > vxg::cloud::agent::proto::osd_caps←
::bkg_color
```

bkg\_color: list of pairs [string (name), optional string (value)], predefined set of possible background colors.

Empty list means – color selection is not supported. Optionaal value is a RGB color code in HEX. Example:  $[["\leftarrow Black", "000000"]]$ 

Definition at line 648 of file caps.h.

#### 10.29.2.3 bkg\_transp

bool vxg::cloud::agent::proto::osd\_caps::bkg\_transp

bkg\_transp: bool, True when OSD supports background transparency

Definition at line 650 of file caps.h.

#### 10.29.2.4 date

bool vxg::cloud::agent::proto::osd\_caps::date

date: bool, True when OSD supports separate date enabling/disabling

Definition at line 629 of file caps.h.

#### 10.29.2.5 date\_format

```
std::vector< std::string> vxg::cloud::agent::proto::osd_caps::date_format
```

date\_format: list of string, supported date formats.

Empty list means – date format selection is not supported. Example: ["YYYY-MM-DD", "MM-DD-YYYY", "DD-MM-YYYY", "YYYY/MM/DD", "MM/DD/YYYY2, "DD/MM/YYYY"]

Definition at line 633 of file caps.h.

#### 10.29.2.6 font\_color

```
\label{thm:std::string} \textbf{std::string} > \texttt{vxg::cloud::agent::proto::osd\_caps} \leftarrow \texttt{::font\_color}
```

font\_color: list of pairs [string (name), optional string (value)], predefined set of possible font colors.

Empty list means – color selection is not supported. Optionaal value is a RGB color code in HEX. Example: [["← Orange", "FF9C00"]]

Definition at line 642 of file caps.h.

# 10.29.2.7 font\_size

```
std::vector< std::string> vxg::cloud::agent::proto::osd_caps::font_size
```

font\_size: list of string, describes supported font sizes.

Empty list means – font size format selection is not supported. Examples: ["16", "32", "48", "64", "auto"] or ["Small", "Normal", "Big"]

Definition at line 637 of file caps.h.

#### 10.29.2.8 system\_id

bool vxg::cloud::agent::proto::osd\_caps::system\_id

system\_id: bool, True when OSD supports separate system\_id enabling/disabling

Definition at line 618 of file caps.h.

#### 10.29.2.9 system\_id\_text

bool vxg::cloud::agent::proto::osd\_caps::system\_id\_text

system\_id\_text: bool, True when OSD supports separate system\_id customization

Definition at line 621 of file caps.h.

#### 10.29.2.10 time

bool vxg::cloud::agent::proto::osd\_caps::time

time: bool, True when OSD supports separate time enabling/disabling

Definition at line 623 of file caps.h.

#### 10.29.2.11 time\_format

std::vector<time\_format\_n> vxg::cloud::agent::proto::osd\_caps::time\_format

time\_format: list of string, supported time formats.

Empty list means – time format selection is not supported. Example: ["12h", "24h"]

Definition at line 627 of file caps.h.

The documentation for this struct was generated from the following file:

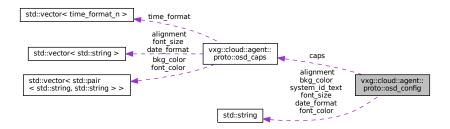

caps.h

# 10.30 vxg::cloud::agent::proto::osd config Struct Reference

OSD config.

#include <agent-proto/objects/config.h>

Collaboration diagram for vxg::cloud::agent::proto::osd\_config:

#### **Data Fields**

· bool system\_id

system\_id: optional bool, enable/disable static part of OSD

std::string system\_id\_text

system\_id\_text: optional string, a static content of OSD

· bool time

time: optional bool, enable/disable time part of OSD

time\_format\_n time\_format

time\_format: optional string, one of predefined values from the time\_format\_n, should be included in caps.

· bool date

date: optional bool, enable/disable date part of OSD

std::string date\_format

date\_format: optional string, one of predefined values from caps

std::string font\_size

font\_size: optional string, one of predefined font sizes from caps

std::string font\_color

font\_color: optional string, name of one of predefined font colors from caps

• std::string bkg\_color

bkg\_color: optional string, name of one of predefined background colors from caps

bool bkg\_transp

bkg\_transp: optional bool, enable/disable OSD background transparency

std::string alignment

alignment: optional string, one of predefined positions from caps

osd\_caps caps

OSD capabilities of the device.

# 10.30.1 Detailed Description

OSD config.

On Screen Display configuration object.

Definition at line 1018 of file config.h.

# 10.36 vxg::media::rtmp\_sink Class Reference

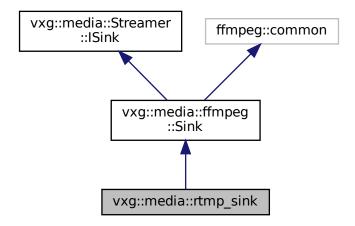

RTMP sink class.

#include <streamer/rtmp\_sink.h>

Inheritance diagram for vxg::media::rtmp\_sink:

Collaboration diagram for vxg::media::rtmp\_sink:

#### **Public Member Functions**

- rtmp\_sink ( std::function < void(vxg::media::Streamer::StreamError) > cb)
  - Construct a new rtmp sink object.
- virtual bool init ( std::string url) override
  - Overriden vxg::media::ffmpeg::Sink::init( std::string, std::string) "init" method with hidden output ffmpeg format.
- virtual void error (Streamer::StreamError stream\_error) override
  - Media processing error callback, called when ISink::process returned false or linked source's ISource::pullFrame returned false, or when ISource::error was called.
- virtual std::string name () override
  - Sink name.
- virtual bool droppable () override
  - If sink of with dropping its media frames.
- bool negotiate ( std::vector < Streamer::StreamInfo > streams\_info)
  - Override negotiate() for removing all data streams.

#### **Additional Inherited Members**

# 10.36.1 Detailed Description

RTMP sink class.

Definition at line 13 of file rtmp sink.h.

## 10.36.2 Constructor & Destructor Documentation

#### 10.36.2.1 rtmp\_sink()

Construct a new rtmp sink object.

#### **Parameters**

in   cb   error callback	in
--------------------------	----

Definition at line 20 of file rtmp\_sink.h.

#### 10.36.3 Member Function Documentation

#### 10.36.3.1 droppable()

```
virtual bool vxg::media::rtmp_sink::droppable ( ) [inline], [override], [virtual]
```

If sink of with dropping its media frames.

## Returns

true Internal media thread allowed to drop frames if internal media queue is full. false No media frames dropping allowed.

Reimplemented from vxg::media::ffmpeg::Sink.

Definition at line 47 of file rtmp\_sink.h.

#### 10.36.3.2 error()

Media processing error callback, called when ISink::process returned false or linked source's ISource::pullFrame returned false, or when ISource::error was called.

#### **Parameters**

Reimplemented from vxg::media::ffmpeg::Sink.

Definition at line 33 of file rtmp\_sink.h.

#### 10.36.3.3 init()

Overriden vxg::media::ffmpeg::Sink::init( std::string, std::string) "init" method with hidden output ffmpeg format.

#### **Parameters**

```
url RTMP url
```

#### Returns

true On success false On failure

Reimplemented from vxg::media::ffmpeg::Sink.

Definition at line 29 of file rtmp\_sink.h.

#### 10.36.3.4 name()

```
virtual std::string vxg::media::rtmp_sink::name ( ) [inline], [override], [virtual]
Sink name.
```

Returns

#### std::string

Reimplemented from vxg::media::ffmpeg::Sink.

Definition at line 45 of file rtmp\_sink.h.

#### 10.36.3.5 negotiate()

Override negotiate() for removing all data streams.

This is required for preventing buffering inside the ffmpeg muxer, ffmpeg waits for at least one packet for each stream or 10 seconds by default before output next chunk, this leads to 10 seconds delay if data track was added to output muxing context but no actual data packets were received hence sparse streams like onvif metadata may significantly increase delay.

#### **Parameters**

in <i>strea</i>	ms_info	- list of streams descrtiptions.
-----------------	---------	----------------------------------

#### Returns

true

false

Reimplemented from vxg::media::ffmpeg::Sink.

Definition at line 60 of file rtmp\_sink.h.

The documentation for this class was generated from the following file:

Overloaded init method.

# **Parameters**

```
in url RTSP URL link
```

#### Returns

true

false

Reimplemented from vxg::media::ffmpeg::Source.

Definition at line 50 of file rtsp\_source.h.

#### 10.38.3.2 name()

```
virtual std::string vxg::media::rtsp_source::name ( ) [inline], [override], [virtual]
```

Source class name.

Returns

#### std::string

Reimplemented from vxg::media::ffmpeg::Source.

Definition at line 132 of file rtsp\_source.h.

The documentation for this class was generated from the following file:

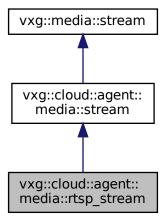

· rtsp\_source.h

# 10.39 vxg::cloud::agent::media::rtsp\_stream Class Reference

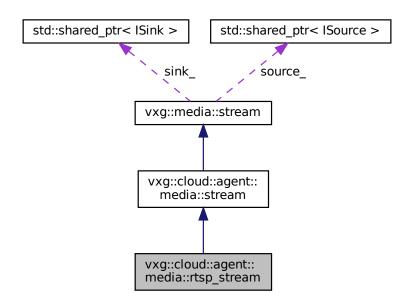

Implementation of the media::stream with RTSP source and NIY stubs.

```
#include <agent/rtsp-stream.h>
```

Inheritance diagram for vxg::cloud::agent::media::rtsp\_stream:

Collaboration diagram for vxg::cloud::agent::media::rtsp\_stream:

# **Public Types**

typedef std::shared\_ptr< rtsp\_stream > ptr

#### **Public Member Functions**

rtsp\_stream ( std::string source\_url, std::string name, bool rtp\_transport\_tcp=true, bool recorder\_needs
 —source=false)

Construct a new rtsp stream object.

- virtual ~rtsp\_stream ()
- virtual bool start ( std::string not used="")
- bool get supported stream (proto::supported stream config &config)

Get the supported stream description.

• virtual bool get\_stream\_caps (proto::stream\_caps &caps) override

Get the media stream caps.

• virtual bool get\_stream\_config (proto::stream\_config &streamConfig)

Get the stream config.

virtual bool set stream config (const proto::stream config &streamConfig)

Set the streams config.

virtual bool get\_snapshot (proto::event\_object::snapshot\_info\_object &snapshot)

Get the snapshot image of this media stream.

• virtual **std::vector**< proto::video\_clip\_info > record\_get\_list (cloud::time begin, cloud::time end, bool align)

Get list of the recorded clips for specific time period.

virtual proto::video clip info record export (cloud::time begin, cloud::time end)

Export recorded clip for specified time.

• virtual bool start\_record ()

Start recording of this media stream.

virtual bool stop\_record ()

Stop recording of this stream.

# **Additional Inherited Members**

# 10.39.1 Detailed Description

Implementation of the media::stream with RTSP source and NIY stubs.

Definition at line 18 of file rtsp-stream.h.

# 10.39.2 Member Typedef Documentation

#### 10.39.2.1 ptr

```
typedef std::shared_ptr<rtsp_stream> vxg::cloud::agent::media::rtsp_stream::ptr
```

Definition at line 34 of file rtsp-stream.h.

#### 10.39.3 Constructor & Destructor Documentation

# 10.39.3.1 rtsp\_stream()

Construct a new rtsp stream object.

#### **Parameters**

source_url	RTSP url
name	Unique stream name
rtp_transport_tcp	true - RTP over TCP; false - RTP over UDP
record_needs_source	Indicates if stream needs source start before calling start_record() virtual method.

Definition at line 43 of file rtsp-stream.h.

#### 10.39.3.2 ∼rtsp\_stream()

#### 10.39.4 Member Function Documentation

#### 10.39.4.1 get\_snapshot()

Get the snapshot image of this media stream.

#### **Parameters**

out	snapshot	snapshot object
-----	----------	-----------------

#### Returns

```
true if snapshot is valid false if snapshot is invalid
```

Implements vxg::cloud::agent::media::stream.

Definition at line 95 of file rtsp-stream.h.

#### 10.39.4.2 get\_stream\_caps()

Get the media stream caps.

video/audio elementary streams caps request passes caps with names of the elementary streams for which caps are required to be filled inside this method

#### **Parameters**

```
out caps
```

#### Returns

true if caps valid false if caps is invalid

Implements vxg::cloud::agent::media::stream.

Definition at line 77 of file rtsp-stream.h.

#### 10.39.4.3 get\_stream\_config()

Get the stream config.

#### **Parameters**

in,out	config	input config contains list of streams for which configuration should be returned
--------	--------	--

#### Returns

```
true if config is valid false if config is invalid
```

Implements vxg::cloud::agent::media::stream.

Definition at line 83 of file rtsp-stream.h.

#### 10.39.4.4 get\_supported\_stream()

Get the supported stream description.

#### **Parameters**

out	supported_stream	Stream supported by device
-----	------------------	----------------------------

# Returns

```
true if supported_stream is valid
false if supported_stream is not valid
```

Implements vxg::cloud::agent::media::stream.

Definition at line 66 of file rtsp-stream.h.

# 10.39.4.5 record\_export()

Export recorded clip for specified time.

#### **Parameters**

begin	
end	

#### Returns

```
proto::video_clip_info
```

Implements vxg::cloud::agent::media::stream.

Definition at line 110 of file rtsp-stream.h.

## 10.39.4.6 record\_get\_list()

Get list of the recorded clips for specific time period.

#### **Parameters**

in	begin	beginning of the time period
in	end	ending of the time period
in	align	Align returned records to key frames and begin/end. If true the implementation should align returned records to not include data with timestamps less than begin and greater than end. Also any returned record MUST start with key frame and the last frame of any not last record in the list MUST be the frame prior to key frame - first frame of the next record.
in	limit	Max records number that may be returned. Value 0 means no limitation.

#### Returns

```
std::vector<proto::video_clip_info>
```

Implements vxg::cloud::agent::media::stream.

Definition at line 103 of file rtsp-stream.h.

### 10.39.4.7 set stream config()

Set the streams config.

#### **Parameters**

in	config	input config contains list of streams for which configuration should be set
----	--------	---

#### Returns

```
true if config successfully set false if config failed to set
```

Implements vxg::cloud::agent::media::stream.

Definition at line 89 of file rtsp-stream.h.

## 10.39.4.8 start()

Reimplemented from vxg::media::stream.

Definition at line 62 of file rtsp-stream.h.

## 10.39.4.9 start\_record()

```
virtual bool vxg::cloud::agent::media::rtsp_stream::start_record ( ) [inline], [virtual]
```

Start recording of this media stream.

Called only if memory card is presented and can be used.

#### Returns

true if recording started false if recording start failed

## See also

```
agent::event_stream::on_get_memorycard_info
```

Implements vxg::cloud::agent::media::stream.

Definition at line 118 of file rtsp-stream.h.

## 10.39.4.10 stop\_record()

```
virtual bool vxg::cloud::agent::media::rtsp_stream::stop_record ( ) [inline], [virtual]
```

Stop recording of this stream.

Returns

true Stopped

false Failed to stop

Implements vxg::cloud::agent::media::stream.

Definition at line 124 of file rtsp-stream.h.

The documentation for this class was generated from the following file:

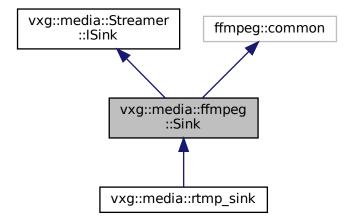

• rtsp-stream.h

# 10.40 vxg::media::ffmpeg::Sink Class Reference

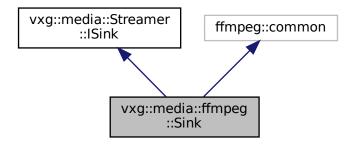

Base ffmpeg sink class.

#include <streamer/ffmpeg\_sink.h>

Inheritance diagram for vxg::media::ffmpeg::Sink:

Collaboration diagram for vxg::media::ffmpeg::Sink:

## **Public Member Functions**

- Sink ()
- virtual ∼Sink ()
- bool init ( std::string url, std::string fmt, std::shared\_ptr< std::vector< uint8\_t >> data\_buffer=nullptr)
   Sink init.
- virtual bool init ( std::string url="")

Init sink.

· virtual bool finit ()

Deinit sink.

- · virtual void stop ()
- virtual void error (Streamer::StreamError stream\_error)

Media processing error callback, called when ISink::process returned false or linked source's ISource::pullFrame returned false, or when ISource::error was called.

• virtual std::string name ()

Sink name.

virtual bool droppable ()

If sink of with dropping its media frames.

virtual bool negotiate ( std::vector< Streamer::StreamInfo >)

Negotiation callback, this method called with collected from the ISource::negotiate media stream description.

## **Additional Inherited Members**

## 10.40.1 Detailed Description

Base ffmpeg sink class.

Definition at line 12 of file ffmpeg\_sink.h.

## 10.40.2 Constructor & Destructor Documentation

#### 10.40.2.1 Sink()

```
vxg::media::ffmpeg::Sink::Sink ( )
```

## 10.40.2.2 ∼Sink()

```
virtual vxg::media::ffmpeg::Sink::~Sink ( ) [virtual]
```

#### 10.40.3 Member Function Documentation

## 10.40.3.1 droppable()

```
virtual bool vxg::media::ffmpeg::Sink::droppable ( ) [inline], [virtual]
```

If sink of with dropping its media frames.

#### Returns

true Internal media thread allowed to drop frames if internal media queue is full. false No media frames dropping allowed.

Implements vxg::media::Streamer::ISink.

Reimplemented in vxg::media::rtmp\_sink.

Definition at line 55 of file ffmpeg\_sink.h.

## 10.40.3.2 error()

Media processing error callback, called when ISink::process returned false or linked source's ISource::pullFrame returned false, or when ISource::error was called.

#### **Parameters**

error Error type.

Implements vxg::media::Streamer::ISink.

Reimplemented in vxg::media::rtmp\_sink.

Definition at line 33 of file ffmpeg\_sink.h.

## 10.40.3.3 finit()

```
virtual bool vxg::media::ffmpeg::Sink::finit ( ) [virtual]
```

Deinit sink.

## Returns

true finit success.

false finit failed.

Implements vxg::media::Streamer::ISink.

## 10.40.3.4 init() [1/2]

## Sink init.

## **Parameters**

url	Output url
fmt	Output format
data_buffer	Output buffer for output to memory, if specified and not nullptr the url will be ignored.

## Returns

true On success false On failure

## 10.40.3.5 init() [2/2]

Init sink.

#### **Parameters**

## Returns

true init success.

false init failed.

Implements vxg::media::Streamer::ISink.

Reimplemented in vxg::media::rtmp\_sink.

#### 10.40.3.6 name()

```
virtual std::string vxg::media::ffmpeg::Sink::name () [inline], [virtual]
```

Sink name.

#### Returns

## std::string

Implements vxg::media::Streamer::ISink.

Reimplemented in vxg::media::rtmp\_sink.

Definition at line 53 of file ffmpeg\_sink.h.

## 10.40.3.7 negotiate()

Negotiation callback, this method called with collected from the ISource::negotiate media stream description.

## **Parameters**

info List of elementary streams descriptions.

## Returns

true If streams descriptions accepted.

false Streams not accepted, will cause media thread stopping.

Reimplemented from vxg::media::Streamer::ISink.

Reimplemented in vxg::media::rtmp\_sink.

#### 10.40.3.8 stop()

```
virtual void vxg::media::ffmpeg::Sink::stop ( ) [virtual]
```

Reimplemented from vxg::media::Streamer::ISink.

The documentation for this class was generated from the following file:

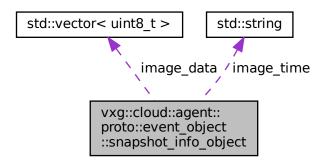

· ffmpeg\_sink.h

# 10.41 vxg::cloud::agent::proto::event\_object::snapshot\_info\_object Struct Reference

Snapshot info.

#include <agent-proto/objects/config.h>

Collaboration diagram for vxg::cloud::agent::proto::event\_object::snapshot\_info\_object:

## **Data Fields**

• std::string image\_time

 $image\_time$ : string,  $image\ UTC\ time\ in\ ISO8601\ format\ YYYYMMDDThhmmss.mmm$ ,  $should\ be\ the\ same\ as\ file\_{\leftarrow}$   $time\ in\ corresponding\ upload\ request$ .

· int width

width: optional int. Width of image in pixels

int height

height: optional int. Height of image in pixels

· int size

size: optional int. Size of image-file in bytes

std::vector < uint8\_t > image\_data
 jpeg snapshot

## 10.41.1 Detailed Description

Snapshot info.

Definition at line 522 of file config.h.

#### 10.41.2 Field Documentation

## 10.41.2.1 height

int vxg::cloud::agent::proto::event\_object::snapshot\_info\_object::height

height: optional int. Height of image in pixels

Definition at line 537 of file config.h.

## 10.41.2.2 image\_data

```
std::vector<uint8_t> vxg::cloud::agent::proto::event_object::snapshot_info_object::image_data
```

jpeg snapshot

Definition at line 542 of file config.h.

## 10.41.2.3 image\_time

```
std::string vxg::cloud::agent::proto::event_object::snapshot_info_object::image_time
```

image\_time: string, image UTC time in ISO8601 format YYYYMMDDThhmmss.mmm, should be the same as file ← \_time in corresponding upload request.

Since the time-stamp is used as an unique ID of the snapshot, CM MUST ensure uniqueness of the time-stamp of all snapshots of a particular camera. If this parameter is accompanied with "width", "height" and "size", server will reply with 3.23 direct\_upload\_url (SRV) and the URL should be used for direct uploading of the image. Otherwise an obsolete way (is not recommended now) of upload can be used (see 6.6 Media files uploading)

Definition at line 533 of file config.h.

## 10.41.2.4 size

int vxg::cloud::agent::proto::event\_object::snapshot\_info\_object::size

size: optional int. Size of image-file in bytes

Definition at line 539 of file config.h.

#### 10.41.2.5 width

int vxg::cloud::agent::proto::event\_object::snapshot\_info\_object::width

width: optional int. Width of image in pixels

Definition at line 535 of file config.h.

Source class name.

• virtual std::vector < Streamer::StreamInfo > negotiate ()

Negotiation callback.

• virtual void stop ()

#### **Additional Inherited Members**

## 10.42.1 Detailed Description

Base ffmpeg source class.

Definition at line 10 of file ffmpeg source.h.

## 10.42.2 Constructor & Destructor Documentation

## 10.42.2.1 Source()

```
vxg::media::ffmpeg::Source::Source ( )
```

Definition at line 9 of file ffmpeg\_source.cc.

#### 10.42.2.2 ∼Source()

```
\verb|vxg::media::ffmpeg::Source::\sim|Source ( ) | [virtual]|
```

Definition at line 12 of file ffmpeg\_source.cc.

## 10.42.3 Member Function Documentation

## 10.42.3.1 finit()

```
void vxg::media::ffmpeg::Source::finit ( ) [virtual]
```

Finit souce.

Implements vxg::media::Streamer::ISource.

Definition at line 30 of file ffmpeg\_source.cc.

## 10.42.3.2 init() [1/3]

Init ffmpeg memory source with specific ffmpeg options.

## **Parameters**

in	input_buffer	Input memory buffer containing whole media.
in	opts	ffmpeg options
in	fmt	ffmpeg input format to prevent auto-detection. ex.: "flv", "mp4", "http" etc.

#### Returns

true

false

Definition at line 20 of file ffmpeg\_source.cc.

## 10.42.3.3 init() [2/3]

Init ffmpeg source with specific ffmpeg options.

## **Parameters**

in	url	Url
in	opts	ffmpeg options
in	fmt	ffmpeg input format to prevent auto-detection. ex.: "flv", "rtsp", "http" etc.

## Returns

true

false

Definition at line 14 of file ffmpeg\_source.cc.

## 10.42.3.4 init() [3/3]

Init source.

#### **Parameters**

url Url if needed.
--------------------

## Returns

true Init success.

false Init failed.

Implements vxg::media::Streamer::ISource.

Reimplemented in vxg::media::rtsp\_source, and vxg::media::rtmp\_source.

Definition at line 26 of file ffmpeg\_source.cc.

#### 10.42.3.5 name()

```
virtual std::string vxg::media::ffmpeg::Source::name ( ) [inline], [virtual]
```

Source class name.

Returns

#### std::string

Implements vxg::media::Streamer::ISource.

Reimplemented in vxg::media::rtsp\_source.

Definition at line 42 of file ffmpeg\_source.h.

#### 10.42.3.6 negotiate()

```
std::vector< StreamInfo > vxg::media::ffmpeg::Source::negotiate ( ) [virtual]
```

Negotiation callback.

Called by internals. Class implementation should return the list of the streams info source will be producing for the sinks, this list will be then passed to the ISink::negotiate method.

Returns

```
std::vector<Streamer::StreamInfo>
```

Implements vxg::media::Streamer::ISource.

Definition at line 58 of file ffmpeg\_source.cc.

## 10.42.3.7 pullFrame()

```
std::shared_ptr< Streamer::MediaFrame > vxg::media::ffmpeg::Source::pullFrame ( ) [virtual]
```

Main method of the Mode::PULL mode data producing.

Called by internals if the source operation mode is Mode::PULL. Implementation should return media frame object with correctly filled fields.

Returns

```
std::shared_ptr<MediaFrame>
```

Implements vxg::media::Streamer::ISource.

Definition at line 111 of file ffmpeg\_source.cc.

## 10.42.3.8 stop()

```
void vxg::media::ffmpeg::Source::stop ( ) [virtual]
```

Reimplemented from vxg::media::Streamer::ISource.

Definition at line 204 of file ffmpeg\_source.cc.

The documentation for this class was generated from the following files:

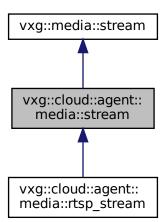

- ffmpeg\_source.h
- ffmpeg\_source.cc

# 10.43 vxg::cloud::agent::media::stream Class Reference

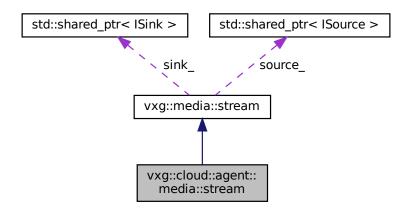

Cloud agent media stream abstract class.

```
#include <agent/stream.h>
```

Inheritance diagram for vxg::cloud::agent::media::stream:

Collaboration diagram for vxg::cloud::agent::media::stream:

## 10.43.3 Constructor & Destructor Documentation

## 10.43.3.1 stream()

Construct a new agent media stream object.

#### **Parameters**

in	name	Unique stream name which will be used by the VXG Cloud API
in	source	Source object pointer
in	sink_error_cb	Callback which will be called on sink error
in	recorder_needs_source	Indicates if stream needs source start before calling start_record() virtual method.

Definition at line 39 of file agent/stream.h.

#### 10.43.3.2 ∼stream()

```
virtual vxg::cloud::agent::media::stream::~stream ( ) [inline], [virtual]
```

Reimplemented from vxg::media::stream.

Definition at line 48 of file agent/stream.h.

## 10.43.4 Member Function Documentation

## 10.43.4.1 get\_snapshot()

Get the snapshot image of this media stream.

#### **Parameters**

out <i>snapshot</i>	snapshot object
---------------------	-----------------

## Returns

true if snapshot is valid false if snapshot is invalid

Implemented in vxg::cloud::agent::media::rtsp\_stream.

#### 10.43.4.2 get\_stream\_caps()

Get the media stream caps.

video/audio elementary streams caps request passes caps with names of the elementary streams for which caps are required to be filled inside this method

#### **Parameters**

#### Returns

true if caps valid false if caps is invalid

Implemented in vxg::cloud::agent::media::rtsp\_stream.

## 10.43.4.3 get\_stream\_config()

Get the stream config.

#### **Parameters**

in, out   config   input config contains list of streams for which configuration
--

#### Returns

true if config is valid false if config is invalid

Implemented in vxg::cloud::agent::media::rtsp\_stream.

## 10.43.4.4 get\_supported\_stream()

Get the supported stream description.

#### **Parameters**

out	supported_stream	Stream supported by device
-----	------------------	----------------------------

#### Returns

true if supported\_stream is valid
false if supported\_stream is not valid

Implemented in vxg::cloud::agent::media::rtsp\_stream.

#### 10.43.4.5 record\_export()

Export recorded clip for specified time.

## **Parameters**

begin	
end	

#### Returns

```
proto::video_clip_info
```

Implemented in vxg::cloud::agent::media::rtsp\_stream.

## 10.43.4.6 record\_get\_list()

Get list of the recorded clips for specific time period.

#### **Parameters**

in	begin	beginning of the time period
in	end	ending of the time period
in	align	Align returned records to key frames and begin/end. If true the implementation should align returned records to not include data with timestamps less than begin and greater than end. Also any returned record MUST start with key frame and the last frame of any not last record in the list MUST be the frame prior to key frame - first frame of the next record.
in	limit	Max records number that may be returned. Value 0 means no limitation.

## Returns

```
std::vector<proto::video_clip_info>
```

Implemented in vxg::cloud::agent::media::rtsp\_stream.

#### 10.43.4.7 record\_needs\_source()

```
virtual bool vxg::cloud::agent::media::stream::record_needs_source ( ) [inline], [virtual]
```

Should returns true if agent::manager should start stream source before calling start\_record()

#### Returns

true agent::manager should start stream source false agent::manager may not start stream source

Definition at line 104 of file agent/stream.h.

## 10.43.4.8 set\_stream\_config()

Set the streams config.

#### **Parameters**

## Returns

true if config successfully set false if config failed to set

Implemented in vxg::cloud::agent::media::rtsp\_stream.

## 10.43.4.9 start\_record()

```
virtual bool vxq::cloud::agent::media::stream::start_record ( ) [pure virtual]
```

Start recording of this media stream.

Called only if memory card is presented and can be used.

## Returns

true if recording started false if recording start failed

## See also

```
agent::event_stream::on_get_memorycard_info
```

Implemented in vxg::cloud::agent::media::rtsp\_stream.

## 10.43.4.10 stop\_record()

```
virtual bool vxg::cloud::agent::media::stream::stop_record ( ) [pure virtual]
```

Stop recording of this stream.

#### Returns

true Stopped

false Failed to stop

Implemented in vxg::cloud::agent::media::rtsp\_stream.

## 10.44.1 Detailed Description

base media stream abstract class

Media stream is the class representing media stream retranslation from the media source derived from the Streamer::ISource to the media sink derived from the Streamer::ISink. For instance, media stream could be a pair of RTSP source and RTMP sink, i.e. such media stream will be a retranslator of the RTSP stream to the RTMP

Definition at line 22 of file streamer/stream.h.

## 10.44.2 Member Typedef Documentation

## 10.44.2.1 ptr

```
typedef std::shared_ptr<stream> vxg::media::stream::ptr
```

std::shared\_ptr to the base\_stream

Definition at line 27 of file streamer/stream.h.

## 10.44.3 Constructor & Destructor Documentation

### 10.44.3.1 stream()

Construct a new base stream object.

#### **Parameters**

name	Unique stream name which will be used by the VXG Cloud API
source	Source object pointer
sink	Sink object pointer

Definition at line 34 of file streamer/stream.h.

## 10.44.3.2 ∼stream()

```
virtual vxg::media::stream::~stream ( ) [inline], [virtual]
```

Reimplemented in vxg::cloud::agent::media::stream.

Definition at line 44 of file streamer/stream.h.

## 10.44.4 Member Function Documentation

## 10.44.4.1 finit\_sink()

```
virtual void vxg::media::stream::finit_sink ( ) [inline], [virtual]
```

Deinitialize sink.

Derived class deinitialize and deallocates base stream::sink

Definition at line 93 of file streamer/stream.h.

## 10.44.4.2 finit\_source()

```
virtual void vxg::media::stream::finit_source ( ) [inline], [virtual]
```

Deinitialize source.

Definition at line 66 of file streamer/stream.h.

#### 10.44.4.3 init\_sink()

Init media sink.

Derived class should allocate and initialize base\_stream::sink\_ with RTMP sink publishing media stream to the RTMP server pointed by the uri

#### **Parameters**

```
in uri sink stream url if needed
```

#### Returns

true Sink started

false Sink start failed

Definition at line 80 of file streamer/stream.h.

#### 10.44.4.4 init\_source()

Initialize the source.

Called by the internal code, derived class should allocate and set base\_stream::source\_ with Streamer::ISink derived object pointer.

#### **Parameters**

url source url

#### Returns

true if successfully initialized source false if source initialization failed

Definition at line 56 of file streamer/stream.h.

## 10.44.5 Field Documentation

#### 10.44.5.1 sink

Streamer::ISink::ptr vxg::media::stream::sink\_ [protected]

media sink

Definition at line 201 of file streamer/stream.h.

#### 10.44.5.2 source

Streamer::ISource::ptr vxg::media::stream::source\_ [protected]

media source

Definition at line 199 of file streamer/stream.h.

# 10.51 vxg::cloud::agent::proto::video\_caps Struct Reference

Video image capabilities.

```
#include <agent-proto/objects/caps.h>
```

Collaboration diagram for vxg::cloud::agent::proto::video\_caps:

#### **Data Fields**

```
    std::vector< mode > vert_flip
```

vert\_flip: list of string, supported vertical flip modes, possible values ["off", "on", "auto"]

std::vector < mode > horz\_flip

horz\_flip: list of string, supported horizontal flip modes, possible values ["off", "on", "auto"]

• std::vector < std::string > tdn

tdn: list of string, supported TDM modes, possible values ["day", "night", "auto"]

• std::vector< mode > ir light

ir\_light: list of string, supported IR light modes, possible values ["off", "on", "auto"]

· bool brightness

brightness: bool, True when camera supports brightness control

· bool contrast

contrast: bool, True when camera supports contrast control

bool saturation

saturation: bool, True when camera supports saturation control

· bool sharpness

sharpness: bool, True when camera supports sharpness control

std::vector< std::string > nr type

nr\_type: list of string, supported noise reduce types.

· bool nr\_level

nr\_level: bool, True when noise reduce filter assumes control of NR level

std::vector< std::string > wb type

wb\_type: list of string, supported white balance types.

bool pwr frequency

pwr\_frequency: bool, True camera supports compensation of images flickering due to flashing of lamps in indoor environment

# 10.51.1 Detailed Description

Video image capabilities.

Definition at line 366 of file caps.h.

#### 10.51.2 Field Documentation

#### 10.51.2.1 brightness

```
bool vxg::cloud::agent::proto::video_caps::brightness

· config.h

# 10.54 vxg::cloud::agent::proto::video\_stream\_config Struct Reference

Video stream config.

```
#include <agent-proto/objects/config.h>
```

Collaboration diagram for vxg::cloud::agent::proto::video\_stream\_config:

# **Data Fields**

· std::string stream

Mandatory: video ES to use.

video\_format format

Mandatory: video encoding format.

· std::string profile

Optional: profile that specifies format, when format assumes it.

• int horz

Mandatory: int (horz) - video resolution width x height.

int vert

Mandatory: int (vert) - video resolution width x height.

double fps

Mandatory: framerate.

bool vbr

Mandatory: prefer VBR; if false or not set CBR should be used.

· int gop

Mandatory: gop size (I-Frame interval);.

int brt

Optional: bitrate, kbps.

• int vbr\_brt

Optional: bitrate for VBR, kbps.

· int quality

Optional: int [-4..4], quality profile hint for encoder, where 0 means normal.

int smoothing

Optional: a smoothing value from range 0-100 (%)

int vxg::cloud::agent::proto::video_stream_config::quality
```

Optional: int [-4..4], quality profile hint for encoder, where 0 means normal.

Definition at line 128 of file config.h.

#### 10.54.2.8 smoothing

```
int vxg::cloud::agent::proto::video_stream_config::smoothing
```

Optional: a smoothing value from range 0-100 (%)

Definition at line 132 of file config.h.

#### 10.54.2.9 stream

```
std::string vxg::cloud::agent::proto::video_stream_config::stream
```

Mandatory: video ES to use.

Definition at line 89 of file config.h.

### 10.54.2.10 vbr

```
bool vxg::cloud::agent::proto::video_stream_config::vbr
```

Mandatory: prefer VBR; if false or not set CBR should be used.

Definition at line 112 of file config.h.

#### 10.54.2.11 vbr\_brt

```
int vxg::cloud::agent::proto::video_stream_config::vbr_brt
```

Optional: bitrate for VBR, kbps.

Definition at line 124 of file config.h.

#### 10.54.2.12 vert

int vxg::cloud::agent::proto::video\_stream\_config::vert

Mandatory: int (vert) - video resolution width x height.

Definition at line 104 of file config.h.

The documentation for this struct was generated from the following file:

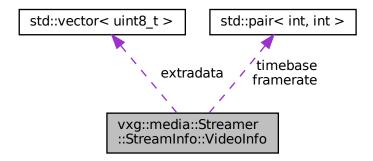

· config.h

# 10.55 vxg::media::Streamer::StreamInfo::VideoInfo Struct Reference

Video stream info.

#include <streamer/base\_streamer.h>

Collaboration diagram for vxg::media::Streamer::StreamInfo::VideoInfo:

#### **Data Fields**

VideoCodec codec

Video codec type.

• int width

Video width if needed.

· int height

Video height if needed.

• std::pair< int, int > framerate

Video framerate if needed.

int bitrate

Video bitrate if needed.

• std::pair< int, int > timebase

Timescale of the timestamps, source fills it with timescale of timestamps source receives, MediaFrame::pts should use this timescale.

std::vector< uint8\_t > extradata

Can be AVC1 extradata or SPS/PPS, source fills it and sink should know and understand this format.

# 10.55.1 Detailed Description

Video stream info.

This structure as well as ISink::negotiate method aimed to inform sink about streams source provides, if sink don't care the values of this structure may be ignored.

Definition at line 310 of file base\_streamer.h.

#### 10.55.2 Field Documentation

#### 10.55.2.1 bitrate

int vxg::media::Streamer::StreamInfo::VideoInfo::bitrate

Video bitrate if needed.

Definition at line 320 of file base\_streamer.h.

#### 10.55.2.2 codec

VideoCodec vxg::media::Streamer::StreamInfo::VideoInfo::codec

Video codec type.

Definition at line 312 of file base\_streamer.h.

#### 10.55.2.3 extradata

```
std::vector<uint8_t> vxg::media::Streamer::StreamInfo::VideoInfo::extradata
```

Can be AVC1 extradata or SPS/PPS, source fills it and sink should know and understand this format.

Definition at line 327 of file base streamer.h.

#### 10.55.2.4 framerate

std::pair<int, int> vxg::media::Streamer::StreamInfo::VideoInfo::framerate

Video framerate if needed.

Definition at line 318 of file base\_streamer.h.

#### 10.55.2.5 height

int vxg::media::Streamer::StreamInfo::VideoInfo::height

Video height if needed.

Definition at line 316 of file base\_streamer.h.

#### 10.55.2.6 timebase

```
std::pair<int, int> vxg::media::Streamer::StreamInfo::VideoInfo::timebase
```

Timescale of the timestamps, source fills it with timescale of timestamps source receives, MediaFrame::pts should use this timescale.

Definition at line 324 of file base\_streamer.h.

#### 10.55.2.7 width

int vxg::media::Streamer::StreamInfo::VideoInfo::width

Video width if needed.

Definition at line 314 of file base streamer.h.

#include <utils/logging.h>
```

Include dependency graph for manager.h:

### **Data Structures**

class vxg::cloud::agent::manager

VXG Cloud agent manager class.

• struct vxg::cloud::agent::manager::event\_state::event\_state\_caps

### **Namespaces**

- vxg
- · vxg::cloud
- · vxg::cloud::agent

VXG Cloud Agent namespace.

#### **Macros**

• #define \_\_CLOUDSTREAMERSDK\_H\_\_

#### **Functions**

• std::string vxg::cloud::agent::version () VXG Cloud Agent library version.

### 11.17.1 Macro Definition Documentation

#### 11.17.1.1 \_\_CLOUDSTREAMERSDK\_H\_\_

```
#define __CLOUDSTREAMERSDK_H__
```

Definition at line 4 of file manager.h.

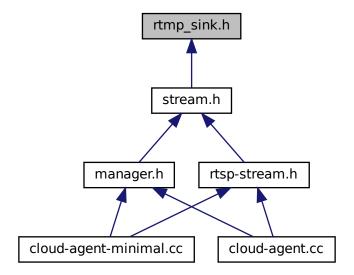

### 11.18 meson.build File Reference

### 11.19 rtmp\_sink.h File Reference

```
#include "ffmpeg_sink.h"
#include "stream.h"
Include dependency graph for rtmp_sink.h:
```

This graph shows which files directly or indirectly include this file:

### **Data Structures**

• class vxg::media::rtmp\_sink RTMP sink class.

### **Namespaces**

- vxg
- vxg::media

### 11.19.1 Detailed Description

RTMP sink

## 11.20 rtmp\_source.h File Reference

```
#include "ffmpeg_source.h"
#include "stream.h"
Include dependency graph for rtmp_source.h:
```

### **Data Structures**

 class vxg::media::rtmp\_source RTMP source class.

### **Namespaces**

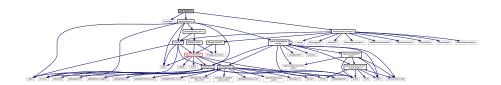

- vxg
- vxg::media

### 11.20.1 Detailed Description

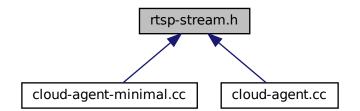

RTMP source

### 11.21 rtsp-stream.h File Reference

#include <functional>
#include <agent/stream.h>
#include <streamer/rtsp\_source.h>
Include dependency graph for rtsp-stream.h:

This graph shows which files directly or indirectly include this file:

### **Data Structures**

• class vxg::cloud::agent::media::rtsp\_stream

Implementation of the media::stream with RTSP source and NIY stubs.

### **Namespaces**

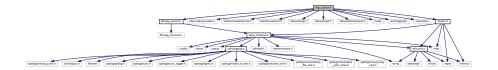

- vxg
- vxg::cloud
- vxg::cloud::agent

VXG Cloud Agent namespace.

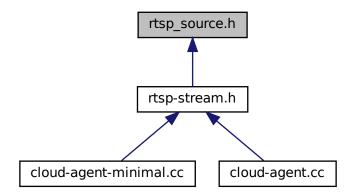

• vxg::cloud::agent::media

# 11.22 rtsp\_source.h File Reference

```
#include "ffmpeg_source.h"
#include "stream.h"
Include dependency graph for rtsp_source.h:
```

This graph shows which files directly or indirectly include this file:

### **Data Structures**

• class vxg::media::rtsp\_source RTSP source class.

### **Namespaces**

- vxg
- vxg::media

### 11.22.1 Detailed Description

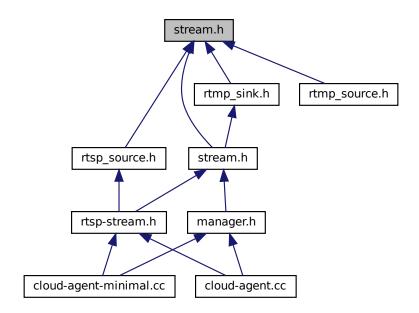

RTSP source

### 11.23 stream.h File Reference

```
#include <map>
#include <memory>
#include <regex>
#include <streamer/base_streamer.h>
#include <utils/utils.h>
Include dependency graph for streamer/stream.h:
```

This graph shows which files directly or indirectly include this file:

### **Data Structures**

• class vxg::media::stream

base media stream abstract class

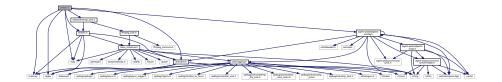

### **Namespaces**

- vxg
- vxg::media

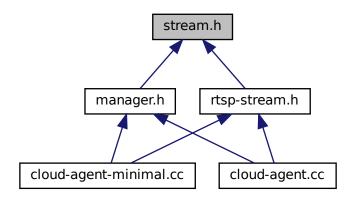

### 11.24 stream.h File Reference

```
#include <map>
#include <memory>
#include <regex>
#include <agent-proto/objects/config.h>
#include <streamer/rtmp_sink.h>
#include <streamer/stream.h>
#include <utils/utils.h>
```

Include dependency graph for agent/stream.h:

This graph shows which files directly or indirectly include this file:

#### **Data Structures**

• class vxg::cloud::agent::media::stream

Cloud agent media stream abstract class.

### **Namespaces**

- vxg
- vxg::cloud
- vxg::cloud::agent

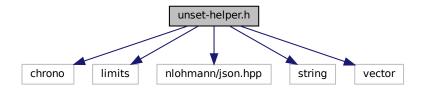

VXG Cloud Agent namespace.

• vxg::cloud::agent::media

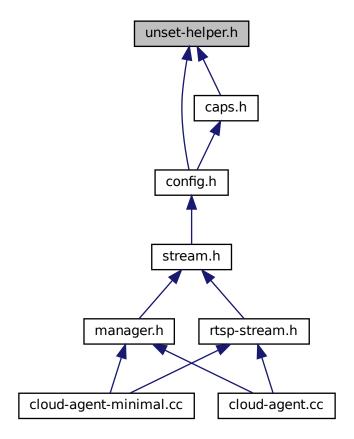

# 11.25 unset-helper.h File Reference

```
#include <chrono>
#include <limits>
#include <nlohmann/json.hpp>
#include <string>
#include <vector>
```

Include dependency graph for unset-helper.h:

This graph shows which files directly or indirectly include this file:

### **Data Structures**

struct alter\_bool

alternative bool class Standard bool type has two states, this class adds 3rd state - undefined.

### **Namespaces**

- vxg
- vxg::cloud
- vxg::cloud::time\_spec

time point

### **Functions**

- std::string unset\_value\_for\_impl ( std::string \*)
- int unset\_value\_for\_impl (int \*)

Returns value of int type that can be treated as unset.

double unset\_value\_for\_impl (double \*)

```
uint64_t unset_value_for_impl (uint64_t *)
int64_t unset_value_for_impl (int64_t *)
vxg::cloud::time unset_value_for_impl (vxg::cloud::time *)

    vxg::cloud::duration unset_value_for_impl (vxg::cloud::duration *)

    nlohmann::json unset value for impl (nlohmann::json *)

• template<typename T >
  Tunset value for ()
      Template function which returns object value treated as 'unset' or uninitialized.

    template<typename T >

  std::vector< T > unset value for impl ( std::vector< T > *)
• template<typename T >
  T unset value for impl (T *)
• template<typename T >
  bool <u>__is_unset</u> (T)
      Used for objects constructed from json, helps to check if original json object has specific field.
template<> bool __is_unset< int > (int t)
      Predicate function checks if int value was not initialized.

    template<> bool __is_unset< std::string > ( std::string t)

    template<> bool is unset< double > (double t)

• template<> bool is unset< vxg::cloud::time > (vxg::cloud::time t)
• template<> bool __is_unset< vxg::cloud::duration > (vxg::cloud::duration t)
• template<> bool __is_unset< nlohmann::json > (nlohmann::json t)

    template<> bool __is_unset< nullptr_t > (nullptr_t t)

• template<typename T >
  bool __is_unset (nlohmann::json t)

    template<> bool __is_unset< alter_bool > (alter_bool t)
```

#### **Variables**

- const std::string UnsetString
- const vxg::cloud::time UnsetTime
- const vxg::cloud::duration UnsetDuration
- · const int UnsetInt

- const double UnsetDouble
- const uint64\_t UnsetUInt64
- const int64 t UnsetInt64

#### 11.25.1 Function Documentation

Definition at line 155 of file unset-helper.h.

#### 11.25.1.2 \_\_is\_unset() [2/2]

```
template<typename T >
bool __is_unset (
          T ) [inline]
```

Used for objects constructed from json, helps to check if original json object has specific field.

You need to declare template specification for new types.

#### See also

```
__is_unset<int>(int t)
```

#### **Template Parameters**

```
T object of type
```

#### Returns

true If object's field was actually set during construction, i.e. original json has such field in it's body. false If object's field wasn't set, original json has no such field. It's also possible that json has such field but its value is set to value treated as unset value.

#### See also

```
__is_unset<>()
```

Definition at line 104 of file unset-helper.h.

### 11.25.1.3 \_\_is\_unset< alter\_bool >()

Definition at line 219 of file unset-helper.h.

#### 11.25.1.4 \_\_is\_unset< double >()

Definition at line 126 of file unset-helper.h.

### 11.25.1.5 \_\_is\_unset< int >()

Predicate function checks if int value was not initialized.

### **Template Parameters**

#### **Parameters**

```
t
```

#### Returns

true value is uninitalized.

false value is initialized.

#### See also

```
unset_value_for<int>()
```

Definition at line 116 of file unset-helper.h.
